PRICE LIST AND ESTIMATES ON APPLICATION

the summer of my twelfth year that first inclined me toward the profession. I was told by friends that the profession was overcrowded, that the colleges were turning out engineers out of all proportion to the demand, &c. But a lack of work has not been one of my experiences up to this time, nor are there any prospects that it will be in the near future. There are many positions waiting for good men to-day. Do not be discouraged by any such idle, pessimistic talk. The United States has really just begun to develop as far as permanent important bridge structure is concerned; and, aside from this, as a result of the conclusion of the late brilliant war—which was, by the way, pre-eminently an engineer's war—new countries have come to us requiring development; and they incidentally brought us at a jump into a world's business instead of a mere home trade.

Now how shall the young engineer enter into the field and commence life in earnest? This first step from college is the beginning, and it is all important to take this first step and make these first associations carefully. I assume every man is taking advantage of his inestimable opportunities in being here; for every year we progress demands more in the matter of thorough theoretical training.

When taking this first step from college, it is most important to shun influential friends who have it in their power to place you in positions beyond your experience; remember it is just as important to progress step by step in the practical work in your profession as it is to follow your regular course in the university. In bridge engineering and construction there are several channels of entering the profession which open before the graduate, any of which may be followed to advantage. The course I shall outline to you, however, appears to me to be the best as indicated by my experience.

I would suggest as the first step a position in the erecting department of some well known bridge company or firm of erection contractors, and the taking up of the work in the same manner as you would in entering a machine shop to acquire familiarity with the use of tools. Start in the gang and learn everything connected with the erection, and further, learn as you gain in experience the power of handling men and the business involved in this important part of your work. It is not necessary to continue at this particular work after it is thoroughly understood; one of the seeming paradoxes of life is the fact that, after you thoroughly know how certain work should be done, it is no longer necessary for you to do it yourself. But you must know how first.

After finishing in the field, I would suggest association with an inspecting firm, one that actually and intelligently inspects; there are many so-called inspecting firms to which the name is a misnomer. In this position as inspector you will be expected to see that your specifications and plans are adhered to, and this will not be hard to do if you proceed about it in the right manner. Do not start in by thinking all reputable concerns and contracting engineers are dishonest—on the contrary, they all court intelligent, sensible inspection, and will assist you. A sly, detective manner is not necessary, or "a-know-it-all" air, both of which are sure to bring trouble. While inspecting there is excellent opportunity to study shop practice, &c., and everything gained here will be of great benefit to you in the next step which I would suggest—the draughting-room. The engineering profession may be called the exact profession; probably no other profession can lay claim to the title with the same warrant. The young engineer who has learned to be accurate has made a long step in advance. This is the first habit to be acquired in the draughting-room. A beautiful drawing is not essential; a correct one is an absolute necessity. A proper experience in detailing takes time; one drawing or many drawings might make simply a good draughtsman, but it requires many months of actual work at the draughting-table to make a good engineer. After this training the next is the designing-room, where the general outline and main features of the bridge are decided upon, and where stresses are figured and main features are determined. All of the training at college and the practical experience gained are needed here, and here the same and even greater accuracy and care must continue.

The four steps I have outlined very roughly compass what I would suggest as the training of a bridge engineer; it can possibly be obtained in ten years, certainly not sooner. Do not push yourself faster than you feel you are moving. Do not let a salary be your first consideration in these years of training; let the experience you are gaining have the greater weight. A proper salary will come later.

WAVERLEY STATION, EDINBURGH.

THE Act for the reconstruction of the Waverley Station was obtained in 1891, but the works were not begun till 1895. The extension of the station was rendered absolutely necessary, says the *Scotsman*, on account of the great increase both of

local and through traffic. The latter traffic by the East Coast and Midland and Waverley routes received, as is well known, a great impetus from the construction of the Forth Bridge. That progress goes on augmenting from year to year. The reconstruction of the station has been a gigantic undertaking, and as it has taken shape its various stages have been noted from time to time. Mention has in this way been made of important works associated with the same object as that for which the station has been enlarged, viz. the doubling of the Mound, Haymarket and Calton Hill tunnels, and the quadrupling of the through lines from Abbeyhill to Corstorphine. There has also been chronicled the reconstruction of the Waverley Bridge, the making of two new carriage entrances to the station from that thoroughfare, and the erection and opening of the handsome new booking hall and offices for the east and south and west traffic. All this has taken time, necessarily so considering that the work has gone on contemporaneously with the daily conduct of a large and increasing traffic. The travelling public, however, have been very patient, and have borne the "light affliction" of the moment in view of the comfort and convenience which in the end the new station would afford. They will hear with pleasure the announcement that the works are now rapidly approaching completion. Operations have recently been seriously delayed by the joiners' strike, but should this soon come to an end it is expected that the whole station will be completed in the early autumn.

As reconstructed the Waverley Station will be the largest railway station in Great Britain. It covers 23 acres of ground, of which exactly one-half, or 11½ acres, are under roof. The two largest and most important stations in England at present with which it may be compared are Liverpool Street Station, London, which is to all intents and purposes two stations, and New Street Station, Birmingham, belonging to the London and North-Western Railway. Liverpool Street Station covers 22½ acres, or half an acre less than the Waverley. It has 6½ acres under roof, or 5½ acres less than the Waverley. New Street, Birmingham, covers 10¾ acres, or 12¼ acres less than Edinburgh. It has 8¾ acres under roof, or 2¾ less than the Waverley. A few leading figures, which are easily stated, show what a great place the Waverley Station has become. In it there are two main line platforms, two platforms for suburban trains, and fifteen dock platforms. These main line platforms are each 560 yards in length. The suburban platforms average 400 yards, and the docks 180 yards in length. The total length of all the platforms is 4,660 yards, or about 2¾ miles, and their area extends to 32,520 square yards. There are eight main lines through the station, and fifty-six dock roads and sidings. These are worked from four signal cabins by 228 points and 290 signals. In all, there are 538 signal and point levers. The signal cabin at the east end of the station is believed to be the largest yet constructed, containing as it does 260 levers. Owing to servitudes and other restrictions the extreme height of the roof could only be 42 feet above the level of the rails. The spans of the main girders of the roof vary from 50 to 80 feet, and these are placed at a uniform distance apart of 37 feet 6 inches. There are thirty-three spans of this width in the length for the station. The cost of the Waverley Station for works alone, exclusive of land, will amount to no less a sum than about 500,000*l*.

Comparing the new station with the old, it may be mentioned that the old Waverley covered an area of 18½ acres, of which 4¾ acres were under roof. Four and a half acres have accordingly been added to the total area of the new station and 6¾ acres to the area under roof. It had two main line platforms only, while the new station has eight, two suburban platforms and nine dock platforms. The main line platforms were 440 yards in length, the suburban platforms 260 yards, while the dock platforms averaged 130 yards in length. The total length of all the platforms was 2,550 yards, or rather less than a mile and a half, so that the platform accommodation has been added to by 2,110 yards, or about 1¼ mile. At Liverpool Street Station there are two main line platforms, two main lines through the station, sixteen dock platforms and thirty-three dock roads and sidings; while at New Street, Birmingham, there are eight main line platforms and twelve main lines through the station, five dock platforms and seventeen dock roads and sidings. At Liverpool Street the main line platforms average 250 yards in length and the docks 220 yards. The total length of platforms is 3,720 yards, and the total area of platforms 24,560 yards. The Waverley accordingly has 940 yards in length more of platform, and 7,960 more square yards of platform than the largest station in London. The total length of the platforms at New Street, Birmingham, is 2,470 yards, or 2,190 yards, about a mile and a quarter, less than the Waverley, while in area the platforms at New Street measure 21,400 square yards, or 11,120 square yards less than Edinburgh. Both at New Street and Liverpool Street the signal arrangements, like those at the Waverley, are very elaborate. Liverpool Street has three signal cabins, containing 424 signal and point levers, which

PATENT
VULCANITE ROOFING

Since the introduction of the patent Vulcanite Roofing into this country it has been ad by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hosp Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and sum than under any other roof. When properly laid repairs are never required, and all roof guaranteed. The roof-surface can be used as a garden, or for any other purpose. The co construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDG TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up inches, being more convenient than the usual damp-course slabs, and saving laps. Price lowe quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 sq ficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requir annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.

Vol. LX. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered. Price 12*s.* 6*d.* Office: Imperial Buildings Ludgate Circus,

ork 153 points and 211 signals. New Street, Birmingham, as six signal cabins, containing 584 signal and point levers, hich work 142 points and 197 signals. In respect of the umber of points and levers the Waverley is also an easy first, ough the New Street Station, Birmingham, seems to have ore levers for working its points and signals.

The number of people who use the Waverley Station in the ourse of the year is enormous. In an interview which he ave to a representative of one of the railway papers last year Ir. Conacher estimated the number at 13,000,000 per annum, nd that is now believed to be below the mark. That would ive roundly an average of over 37,000 a day. Last spring oliday there were no fewer than 36,599 bookings from the Waverley alone, and that figure did not include season and aders' tickets, all who booked at the suburban and Hay-arket stations, and all the people who used the station with ckets from other places in Scotland and England. Then ere has to be taken into account the number of people who me to the station to see friends arrive and depart; so that r the traffic which has developed here a very large building as required. On a busy day last summer the gross total of ains of all kinds and light engines dealt with in the enty-four hours going out and into the Waverley Station as no fewer than 1,196. Of these 391 loaded pas-nger trains went out from or came into the east nd of the station, and 258 went out from or came to the west end—making a total of 649 trains. The rest were npty trains which had to be handled for shunting purposes, ods trains which passed through the station, mostly at night, nd engines going to and from the watering standards and rning tables. In Liverpool Street Station the corresponding gures were 1,070 trains. Taking the actual number of loaded ains, 649, and giving an average of 100 persons in each, that ould mean a total of 64,900 people carried out from and into e Waverley per day in the summer months. If the average raised to 150 per train, that brings up the total to about o,000, which is nearer the mark in the busy season than the her. The figures relating to the cab traffic at the Waverley ation are also interesting. On August 1, 1896, according to tual count, 1,160 cabs drove up with people between 8 30 A M. nd 10.30 A.M.—580 per hour, or 9 a minute. As many as 14 minute have been dealt with on busy days. The new entrance nd exit roads and the ample space in front of the booking alls alone make this possible.

The plans for the reconstruction of the Waverley Station were by Messrs. Blyth & Westland, C.E., George Street, Edinburgh, under whose supervision the work has been carried out.

CRICHTON CHURCH.

THE ancient collegiate church of Crichton, now the parish church, stands six miles south of Dalkeith, its high square tower being a familiar landmark to the traveller by the Waverley route, who to the south looks down on Borthwick Keep and Church, and turning to the north surveys the famous castle of Crichton, with the church in the background. During the past twelve months Crichton Church has been undergoing extensive alterations and improvements—in fact, a thorough restoration—and it was reopened last week. The church has a most interesting history. It was founded on December 26, 1449, by Sir William Crichtoun, Chancellor of Scotland, "out of thankfulness and gratitude to Almighty God for all the manifold deliverances He had vouchsafed to him." There were altogether some thirty-eight of these churches in Scotland at the Reformation, and they had a regular staff (or college) of officials, that of Crichton (or Crichtoun, as it was formerly spelt) consisting of a provost with nine prebends and two singing boys, who would take part in the daily service. An old record puts it that these churches were maintained chiefly so "that prayers could be said and masses sung for the souls of the founder and his relations and benefactors." Little is known of the fate of the church at the Reformation, but about seventy or eighty years after it is recorded that "divine worship has been conducted in it for some time owing to the ruinous condition of the parish church," and in 1641 it was declared by Act of Parliament to be "the parish church for all time coming."

It would seem that at first the chancel was used for the place of worship, but some time previous to 1790 they used the transepts, but again changed to the chancel. The nave was never built. With galleries on three sides and the pulpit on the fourth side, worship continued to be regularly conducted till the beginning of May last year. All this changing from chancel to transepts and back again was not accomplished without serious injury to the fabric. Without any regard whatever to the amenity of the building, according to the caprice of the heritor, doors and windows were built up and new ones cut out in their place. Doubtless all this vandalism was perpetrated in the interests of church compactness and

HONE'S HYDRO-PNEUMATIC SEWERAGE SYSTEM.
The ONLY Perfect System for Sewering Town Areas, Residences, Public Buildings.
In Operation at Eastbourne, Southampton, Warrington, Fenton, Henley-on-Thames, Houses of Parliament, Heston and Isleworth, Hampton Wick, Rangoon (Burma), Campos (Brazil), Slaughter Houses, Moscow, and numerous other places.
lfacturers:—HUGHES & LANCASTER, Albany Buildings, 47 Victoria St., Westminster, S.W.

homely comfort; one could not help feeling in it the greasy domesticity of the Georgian era. But that was not the worst of it, as of late years the internal fittings had fallen into a deplorable condition. Thus, inside the chancel used for worship the floor was rotten, seats were giving way, walls were damp and green with mould; indeed, a more desolate and unwholesome place it would be hard to conceive. Besides, the transepts had been walled off from the chancel, and one of them was used for storing the grave-digger's tools, while the windows of both were built up with rubble.

The aim of the committee, consisting of the chief heritor and the minister of Crichton—acting with the advice of Messrs. Hardy & Wright, architects, Edinburgh—has been, in a word, to restore the church to its original condition. The first step was to clear out all modern innovations, leaving only the bare walls as they stood in all the strength that 4 feet 6 inches of solid masonry flanked with buttresses could give. The old doorways were restored—as good fortune had it, there was just sufficient of the old moulding to go upon in each case—while the modern doors were built up. So with the modern windows. One of the most interesting details in the restoration was the discovery, under the rubble that filled the transept window, of the springers of the tracery head, quite intact, so that all that was required was to fill in the outline thus suggested. An old porch at the east window was removed and the window restored to its original size, 21 feet high, 10 feet broad, and stone mullions and tracery work were, of course, put in place of the old wooden frame. One small window remained intact, as if specially to serve as a model for the others, one of which had been transformed into a doorway. The porch on the north side was removed to allow of this window being reconverted, and during this progress the foundations of the old sacristy were discovered. On these a vestry has been built. A new floor, asphalted beneath and ventilated, has been put in, while comfortable pews have taken the place of the old high-backed, narrow seats.

By the generosity of friends several of the windows have been suitably decorated. The family of the late Mr. Crawford, minister of the parish, have dedicated the south-east chancel window to his memory, filling it with figures of Moses, the law-giver, and John the Baptist, the forerunner. The large east window has been choicely filled by the gift of Mrs. Reid, widow of the late Mr. James Reid, Stirling, who had a connection with the district. The subject is the agony in Gethsemane. On the four panels are shown the crowd crossing the brook Kedron, Christ kneeling in prayer, the Angel strengthening Him, and the three disciples asleep. Under the east window has been placed an oak screen, gifted by Mrs. Callander, which also adds to the value of the furnishings.

The church of Crichton was the only one of the twenty-three parishes in the Dalkeith Presbytery without a musical instrument, and so to complete the restoration an organ, the workmanship of Messrs. Joseph Brook & Co., Glasgow, has also been procured, and this, it is expected, will prove a very fine instrument.

Altogether the restoration work on the part of the tradesmen and others employed has been efficiently carried out, and the result must be most pleasing to the heritors, the parishioners and to the ministers of the parish. The cost in all will be something like 2,000*l.*, of which 1,200*l.* goes to the restoration proper.

PATENTS.

THE WEEK.

THE Metropolitan Asylums Board have decided to expend 400*l.* on the construction of models of the North-Eastern Hospital and the Brook Hospital, from drawings and particulars to be supplied by the respective architects, for the Paris Exhibition of 1900. It would be desirable if some other authorities would give evidence of their activity in building by sending models of their works. At the last meeting on Saturday plans were approved for the erection at Brentwood of a school for children who were suffering from various forms of ophthalmia. The building is expected to cost at least 106,600*l.* A more important work will be the new Southern Hospital, which is to contain 720 ordinary and 80 infirmary beds. The estimated cost is 227,454*l.* Both sets of drawings have yet to receive the sanction of the Local Government Board.

THE annual meeting of the British Association of Waterworks Engineers was opened on Monday at Burlington House. The president, Mr. WATTS, said that during the present session of Parliament about sixty Bills had been promoted for the extension of hydraulic works, the estimates of which would amount to several millions sterling, whilst the capital of existing works was 48½ millions. Probably at no time in the history of waterworks have such gigantic and valuable schemes been before the country. Mr. WATTS considered the future outlook for water engineers was good, for there was sure to be a demand for competent men. Year by year the population was increasing, and the average rate of consumption was advancing on account of the more refined habits of the people. Sources of water were becoming more scarce and difficult to obtain, and the genius of the water engineer would be taxed to find water for the wants of the rising generation. The roofing space of large towns was capable of collecting quantities of water for many other purposes than domestic supply if they had the means of storing it. By this means large supplies of water could be utilised that were not at present available. When every inch of rainfall provided 22,615 gallons per acre something should be done to save so large a supply. The flat roofs of some of the Lancashire cotton mills provided fair supplies of water in case of fire, and the plan, he thought, might be extended with advantage. Mr. WATTS might also have pointed out the dog in the manger policy which inspires several of the provincial municipalities. Larger supplies than are required are monopolised. But as long as the selection of catchment basins is not overlooked by Government authorities, and private Bills confer extraordinary rights, it must be expected that the necessities of smaller towns will be sacrificed to those which are larger and wealthier.

THE position of sub-contractors' men in relation to contractors is a subject which might well engage the attention of builders' associations. There is no doubt that the men who are directly employed by the contractor very often impede the men who are indirectly employed. But a case which was heard before Mr. ADSHEAD ELLIOTT as arbitrator in Manchester on Tuesday suggests that it would be well to have definite notions about the position of sub-contractors' men in other ways. The applicant was a bricksetter's labourer, and was engaged on some works for which Messrs. ROBERT NEILL & SONS, who are leading builders in Lancashire, were the contractors. The man assisted Messrs. NEILL'S men in removing columns, and in the course of the work he was injured. The question was, by whom was he employed? The foreman for Messrs. NEILL admitted that on the day in question he asked the sub-contractor to lend him some men, but when the accident occurred the labourer was not employed by his authority. Messrs. NEILL defended the action on the ground that if they were compelled to pay compensation to sub-contractors' men who meddled with their work after working hours the liability would be onerous. The arbitrator said that the only man who could possibly bring the applicant into the employment of the firm was the foreman. But he denied that he had obtained the aid of the man after 4 o'clock, and the accident occurred after 5.30. The application was therefore dismissed. In one sense the result is unsatisfactory, for, with a firm whose works are so well organised as those of Messrs. NEILL, how could a man be allowed to "meddle" with any of the operations without the knowledge of some official? The removal and setting up of columns cannot be considered a pastime. The men engaged in it are exposed to contingencies, and on that account men alone who have a definite position should be employed. A conciliation board would do well to take up the subject and consider it in all its varieties.

IT was stated at a late meeting in Northampton that since 1882 the sum of 43,827*l.* was expended on the restoration of Peterborough Cathedral, while no less than 28,504*l.* was disbursed for special purposes during the same period. The dean and chapter and restoration committee desire to complete the works before the end of the century, but to attain that end they must be provided with 6,500*l.* Earl SPENCER, who presided at the meeting, said that in the restoration of the northern gable, 1,836 out of 2,000 stones taken down had been replaced in their original position, and only 170 stones which were entirely decayed had been replaced, and of 220 stones in the great arch only seven required replacing. His lordship should have known that the numerical test is not a satisfactory one in building, and much of the money expended on restoration was employed to make up for the deficiencies of Norman jerry-building. The Earl was, therefore, not justified when he said that if the architects of the present day thought they could improve on the work and designs and decorations of the great men, those giants who designed our churches in Norman times, they would find that they were not right, and that the work which they substituted for the old work would not stand the test of time. Lord SPENCER could easily have ascertained that architects are too much disposed to show reverence for the work of their predecessors. But when massive columns are found to be little more than hollow shams, the public safety demands that they should be strengthened at all cost. Everyone would agree with his Lordship when he spoke of the splendid design of Peterborough Cathedral, but it is a fallacy to suppose that architecture consists simply in producing buildings that will look well on paper.

THE picture on which the late Sir EDWARD BURNE-JONES was engaged at the time of his death will be lent by the executors for the Liverpool Autumn Exhibition. Although unfinished, the artist had worked on it for fourteen years. It is 21 feet in length. The curator, Mr. DYALL, has visited the Royal Academy with a view to obtaining works for the Autumn Exhibition, and he expresses the opinion that in the Academy is a large number of very beautiful works, and the general average maintains in a high degree the great position to which English art has attained and compares favourably with the productions of other countries. The curator believes that this opinion of British art will be fully endorsed at the ensuing Autumn Exhibition, when many of the best works of the season, which have been promised as contributions, will show that artists of very great ability are actively working, and with much success, to do honour to art and to carry on its best traditions.

WE have published an illustration of the Cricket Pavilion for the Berks County Club at Elm Park, Reading. It was designed by Mr. G. W. WEBB. Through the influence of the then chairman, the late Mr. C. T. MURDOCH, M.P., the debt on the pavilion has been cleared off. In order to show their gratitude the club have erected an alabaster tablet as his memorial. It bears the following inscription:—"This pavilion was completed as a memorial to the late Mr. CHARLES TOWNSHEND MURDOCH, M.P. for Reading, the first chairman of the Berkshire County Cricket Club, whose premature death on July 7, 1898, has deprived the club of one of its most active and energetic supporters. This tablet was unveiled by H.R.H. PRINCE CHRISTIAN, K.G., president, on May 22, 1899." The original drawing which we reproduced was presented to the Prince. It is now proposed to make an effort for the purchase of the cricket ground. A sum of between five and six thousand pounds will be required.

THE COMACINI.*

IT is a truism to say that the simplest building must have a designer. He may not be called an architect, and he may not have prepared elaborate plans, but he must have had an idea of what was to be accomplished before the works were commenced. As a rule, however, his existence is ignored. The descriptions of new buildings which occasionally appear in newspapers rarely recognise the services of the designers. The writers do not, we suppose, mean to be offensive. They are simply following a long course of precedents. As every one knows, there are many important buildings of which the architects are unknown. As a consequence an architectural history on a biographical basis, which, after all, is the only proper mode of treatment, is an impossibility. We might easily suppose from the pages of the numerous histories that buildings were organisms which grew and developed, became sublime or insignificant, by some power inherent in them. Some theorists have declared their belief that the Mediæval builders were so humble in spirit they concealed their identity from religious motives, and it has been also supposed that many of the Roman architects are unknown because they were slaves. In our time it is often said that the names of the true designers of buildings are enveloped in darkness because, if they do not designate slaves, they at least signify servitude.

Architects generally accept their ignoring as a matter of course, and make the best of it. But it is still an injustice. Painters and sculptors can turn their works into "livelong monuments;" but the mightier buildings rarely serve as memorials of their architects, and, even when they are meritorious, bring as little renown as "this season's patterns" or the articles in journals. There are "Old Mortalities" who endeavour to rescue memories of those who laboured in several fields of activity, but in architecture so many strata have to be passed through before the deciphering can be commenced, the most eager investigator is afraid to commence operations.

It is, therefore, with feelings of indebtedness and admiration that an architect must begin the study of "The Cathedral Builders," by the excellent writer known as "LEADER SCOTT," who has already thrown light on much which was obscure in the history of Italian art. What has been undertaken is not merely the history of church architecture in Europe during several centuries, for that has been attempted repeatedly, but the still harder task of rehabilitating a school of architecture the existence of which was hardly suspected until our time. The author has become the champion of the builders of Como, and maintains that "all the different Italian styles, whose names are legion—being Lombard-Byzantine at Ravenna and Venice, Romanesque at Pisa and Lucca, Lombard-Gothic at Milan, Norman-Saracen in Sicily and the south—are nothing more than the different developments in differing climates and ages of the art of one powerful guild of sculptor-builders, who nursed the seed of Roman art on the borderland of the falling Roman Empire and spread the growth in far-off countries. . . . It was the Comacine masters who carried the classic germs and planted them in foreign soils; it was the brethren of the *Libera Muratori* who, from their headquarters at Como, were sent by GREGORY THE GREAT to England with Saint AUGUSTINE to build churches for his converts; by GREGORY II. to Germany, with BONIFACE on a similar mission; and were by CHARLEMAGNE taken to France to build his church at Aix-la-Chapelle, the prototype of French Gothic." Every student of architecture knows that the regularity which prevailed in the art for a long period has been ascribed by some writers to the masonic, and by others to the monastic, organisation. But that Como should be the primal source from whence what was characteristic in several styles, or that the development began there, was not imagined, although THOMAS HOPE must have had some glimmering of the theory on the subject. Since the existence was discovered of several generations of the family who lived in Como, and were known as the Cosmati, much interest was taken in them; but the general conclusion was that they were craftsmen who inherited and acquired peculiar skill, and resembled other families who were connected with building. Professor GIUSEPPE MEZZARIO was apparently the first who endeavoured to explain the importance of the Como masters, and his researches have been utilised by the author of "The Cathedral Builders."

In a case of the kind there are two classes of evidence, viz. documentary and architectural. Are there any trustworthy records existing which reveal the employment of the Comacine masters? With a subject so long neglected—for MEZZARIO's book appeared only in 1893—it is not to be expected that documentary evidence should be complete. In Italy and elsewhere there may be many entries in archives which confirm the theory of the importance of the artists. Some are mentioned in the volume, which are of remarkable interest. MURATORI, for instance, discovered an edict dated A.D. 643, and signed by King ROTHARIS, one of the Longobards, relating to the employment of a Magister Comacinus, as if that were the ordinary term to designate an architect, master of works or contractor. The following translation is given of two of the clauses :—

> If the Comacine Master, with his *colleganti* (colleagues), shall have contracted to restore or build the house of any person whatsoever, the contract for payment being made, and it chances that some one shall die by the fall of the said house, or any material or stones from it, the owner of the said house shall not be cited by the *Magister Comacinus* or his brethren to compensate them for homicide or injury; because, having for their own gain contracted for the payment of the building, they must sustain the risks and injuries thereof.
>
> If any person has engaged or hired one or more of the Comacine Masters to design a work (*conduxerit ad operam dictandam*) or to daily assist his workmen in building a palace or a house, and it should happen that by reason of the house some Comacine should be killed, the owner of the house is not considered responsible; but if a pole or a stone shall kill or injure any extraneous person, the Master Builder shall not bear the blame, but the person who hired him shall make compensation.

Supposing it is said that Comacine was a generic designation, just as provincial names are still applied to various classes of Paris labourers, regardless of their origin, yet the word still shows that in the seventh century there was a popular belief in the connection between Como and building, and which was founded on facts of some kind. According to our author, the chief reason was "that when Rome lay a heap of ruins under the barbarians, *the Collegium*, or *a Collegium*, fled to independent Como; and there in after centuries they were employed by the Longobards, and ended in again becoming a powerful guild." They are assumed to have been the successors of the Roman architects and builders, and the predecessors of the Mediæval guilds. CESARE CANTU considers they were the original Free Masons.

Como was not a mere refuge which offered safety from its obscurity. PLINY the Younger possessed a villa there, and restored a temple under the direction of MUSTIO, who was, it is said, a local architect. CATULLUS the poet was also a resident on the hills. The district possessed privileges under the Romans, such as exemption from certain taxes and from military service, which were confirmed by OTHO in A.D. 962. But although we are disposed to admit that Como was too delightful a region to become the scene of cruelties against refugees of any importance, it is only by allowing imagination unrestricted freedom that we can agree with the author when she says :—"We need not, then, consider it improbable, if in the dark centuries when the Roman empire was dying out, and its glorious temples and streets falling into ruin under the successive inroads of half-savage despoilers; when the arts and sciences were falling into disuse or being enslaved; and when no place was safe from persecution and warfare, the Guild of Architects should fly for safety to almost the only free spot in Italy; and here, though they could no longer practise their craft, they preserved the legendary knowledge and precepts which, as history implies, came down to them through VITRUVIUS from older sources, some say from SOLOMON's builders themselves." If LEADER SCOTT knew how easily architects lose power when they are without employment, there would be less readiness to believe they could form themselves into a brotherhood to meditate over ancient traditions and to make

* *The Cathedral Builders: The Story of a great Masonic Guild.* By Leader Scott, with eighty-three illustrations. (London: Sampson Low, Marston & Co., Limited.)

arrangements for enlightening posterity. The probability is that in the worst days of Italy there was no cessation of building work. The clergy believed in the necessity of churches, and although the buildings might be overthrown by the invaders they were likely to be rebuilt when the danger was over. The Longobards were as eligible as the natives to be members of the Christian Church, and if they desired buildings to worship in they would soon be gratified.

Mr. Ruskin at one time made Lombard architecture appear in such a favourable light that muscular Christians fancied it was the variety which best expressed their peculiar combination of physical and mental powers. The serpents, dragons, and gryphons were not tamed or stingless things like those of the later Romans, but could tear each other or any other being that was in their way. The style was taken to be a warrior's architecture, and the ornament was supposed to be produced by hands which had wielded weapons effectively. When, therefore, Leader Scott says, "What are called Lombard buildings could not have been the work of the Longobards themselves," the grounds of architectural criticism are shaken. Are the early Lombard churches the work of rough soldiers who were awkward in handling tools, and were less accustomed than barbarian artists to carving figures, or do they present the characteristics of an age of decadence and dim recollections of Vitruvius and the ancients? If architecture is comparable to a chain, there are unquestionably some links missing which should connect Lombard with Roman characteristics. This is admitted in "The Cathedral Builders" when it is said:—"These Comacine artists began with the only style of art they had been educated up to, and, though retaining old traditions, they had fallen out of practice during a century or two, while invaders ravaged their country, and had to begin again with low art, little skill, and unused imagination. But with the new impulse given to art their skill increased, they gained a wider range of imagination, greater breadth of design, going on century by century, from the first solid, heavy, little structures, to the airy lightness of the florid Romanesque—the marriage of East and West." To award credit to those to whom it is due is an obligation; but, apart from that, there is not much importance in determining whether the later architecture of Europe was derived from a worn-out classicism or from a defective interpretation of classic forms. In either case the beginning was only a germ, which afterwards was developed in a way which could not have been anticipated. Roman architecture under the most favourable conditions never gave signs of such changes as we see in following the course of the Lombardic, Romanesque and Gothic styles. Is it not therefore more likely that the new impulse began with a race that was open to change and was under no allegiance to precedents?

The difference between Roman and Lombard sculptured ornament is so remarkable, we are not surprised our author endeavours to explain it as an unavoidable ecclesiological necessity. If the Longobard carving shows a desire to excite terror, which is supposed to be the source of the sublime, we are to conclude it was not from any vanity in the sculptors, but from the desire to express for the benefit of the unlettered masses "a mystical religion represented to their minds in signs and parables," and to display "a sign of an older Bible lore among the Hebrews and other ancient peoples." The spirit of Christian, or rather Roman, symbolism, it seems to us, was suggested by the decoration of the Catacombs, in which we have none of the terrible forms we encounter in the Lombard churches. The same spirit animates the miscellany of figures in the Loggia of the Vatican at a much later period. There is as much variety as we find among Lombard work, and the combinations are often odd, but there is no suggestion of the war of races. Pompeii exhibits a similar avoidance of painful subjects. The Comacini masters must have sadly deteriorated when they revelled in "lines of sculptured stones, a queer mixture of angels, demons, saints and monsters, that seems a nightmare dream of Mediæval superstitions." The manner of introducing bands of such monstrosities between courses of ashlar across façades is by itself enough to indicate the distance between Lombards and Romans.

The origins of architectural styles are too obscure for any inquirer to display dogmatism. It is mainly opposing conjecture to conjecture. As there are people who can see "Helen's beauty on a brow of Egypt," so we suppose there are others who will see Rome in all the transformations of buildings during a thousand years. It is true that after so much has been manifested in form and ornament, we are still in the nineteenth century drawing inspiration from the work of the ancient *Magistri*; but the question is, Was the copying commenced directly or indirectly? "C'est le premier pas qui coûte." But if we allow the existence of the Comacini at one time, was it inevitable that they should monopolise the buildings for an indefinite period? In the early Middle Ages there was scope for the display of ability, and the Church, which allowed all classes to compete for its appointments, would hardly insist on hereditary architects. But Leader Scott will allow nobody but her protégés to obtain commissions. A charitable man in A.D. 805 arranged for the bestowal of a dole of bread and wine in Lucca, and he describes himself as "Natalis, homo transpadanus, magister castarius." The simple words gave rise to this commentary:—"Here we see the Comacine Master settled as leading architect in Lucca, far from his native land beyond the Po, and so flourishing that he can dispense large charities." It is a pleasing interpretation, and we confess we prefer the commentary to the original text, for we all like to be flourishing and benevolent; but is it warranted? The sentence suggests the literary skill of the book; deficiencies in the evidence are compensated for in the most agreeable fashion, until we at least believe the Comacini were amongst the greatest of the world's benefactors.

Both England and Ireland were, we are informed, no less their debtors than Pavia, Pisa and Lucca. The Norman buildings show some kinship with the Lombardic; but is it not going too far to suggest that Rahere, when he resolved to build St. Bartholomew's in Smithfield, brought Comacines with him from Rome? The Rev. W. Miles Barnes, the author's brother, who has contributed a chapter on "The Origin of Saxon Architecture," is no less liberal in his interpretations. Pope Gregory's instructions to use after purification any pagan temples which might exist in Britain is taken to mean that "Mellitus had with him architects who were qualified to carry out the necessary repairs." Because Paulinus was described as *Magister* we are told that "he may have graduated in the Comacine school of architecture." Augustine is also supposed to have been accompanied by several architects and builders when he landed on the Kentish coast, and "the Comacines who settled with Augustine in the royal city of Canterbury must have established according to their custom a lodge and a *schola* in that city."

The Irish round towers have given rise to so many theories, no one will be surprised to find them brought forward as evidence of the ubiquitous Comacines. There are towers in Italy near churches which are supposed to be their work. Is it not therefore likely, it is asked, that some Pope should have counselled the Irish missionaries to take back with them to Ireland enough members of the guild to erect similar structures? It is also maintained that Irish crosses bear all the marks of Comacine work. Hitherto it was supposed the ornamentation was derived from Celtic jewellery, but as the archæologists of the British Museum are doubtful whether any of the goldsmith's work bearing the title was the work of Celtic fingers, who can tell from whence came the models of the crosses? If Italian masons came to Ireland, would not the earlier churches have more claim to be considered architectural works?

After Thackeray had entranced his auditors with his lively description of Dick Steele as a boy, he startled them by saying that he was without any sort of authority for all he had said. That method has to be followed in many works which relate to the lives of men. Two and two can be put together, but the result must appear not as four, but as forty or four hundred. There is no use in objecting to the operation. A writer like Thackeray, who was taught in Steele's school, although he professed to have seen the flogging-block only as an amateur, and had lived in spirit in Queen Anne's time, was likely to have guessed rightly about many incidents, although his conclusions would not be accepted in the law courts. Facts which are without connection are not left isolated even in science. Leader

SCOTT has undoubtedly accumulated many facts from mouldy manuscripts., as well as from records in stone. Every architect who has given any care to Italian buildings has observed some of them, but they are accepted as puzzles which would take too much time to solve, and are neglected. In "The Cathedral Builders" they are brought together with infinite patience and skill, and we have no right to grumble if the connecting material appears to resemble what is ancient and genuine. It is a case of restoration, and any one who cannot detect what is modern must have a very slight acquaintance with the history of art. We have, as in duty bound, humbly pointed to some of the parts where the Historic Muse assumes an especially learned air and professes to enlighten us about professional practice in Italy and elsewhere, but we dare not deny the attractiveness of the posing. The book will be pleasant reading during the holidays, and, besides opening out new lines of thought, it will suggest some of the deficiencies of the various histories of the art. The numerous illustrations of churches, which are all of large size and selected with judgment, are almost enough to demonstrate some of the most important characteristics of ecclesiastical art in Italy.

AN IRISH COLLEGE OF SCIENCE.

By A CORRESPONDENT.

IN 1844 a remarkable volume appeared which was entitled "The Industrial Resources of Ireland." The author, Dr. ROBERT KANE, was one of LIEBIG's pupils, and he had gathered the information found in his book for courses of lectures which he delivered before the Dublin Society. He demonstrated that if Ireland was surrounded by a brazen wall, as was suggested by the great Bishop BERKELEY, the inhabitants would be able to survive although deprived of foreign supplies. But for that purpose it was necessary to be competent to use the materials with which nature enriched the island. It was notorious, according to the author, that in Ireland there was a deficiency of technical knowledge, and Dr. KANE aptly introduced a reference to a speech by one of the Belgian Ministers, who advocated the necessity of an organisation for technical instruction in his country, as otherwise it was feared that Belgium would become degraded to the level of Ireland. The book was written with the best intentions, but it would have been better if it had never appeared. Dr. KANE was a laboratory student, and being fresh from Germany, he believed in theories. If he were acquainted with industries he must have known that many of the most successful producers would have found a difficulty in enunciating a theory of what they did. Let an order be given for most kinds of work, and it could be then carried out in Ireland. But at the time a new school of men was arising, who, if wanting in experience, made up for the deficiency in self-confidence. The late Lord PLAYFAIR was one representative, and when a mere boy had the hardihood to appear before English agriculturists as a teacher. Dr. KANE was another, and although he never aided industry by discoveries or inventions, it was supposed that if he cared he could at any time turn the Irish bogs into gold mines. The only result of his teaching was to make many people believe that without the possession of certificates from men like himself it was impossible for any one to understand materials or to turn them to account. In other words, it was an anticipation of the Science and Art Department and its system of amateurism. But the consequences for Irishmen were serious, for it was taken for granted that they were incapable to undertake industrial operations of importance.

As the book was accepted as a revelation by the Government of the day they decided on establishing a college of science or museum of industry in Dublin. The lease of one of the stately old houses in Stephen's Green was purchased in 1846, and the building was converted into classrooms, laboratories, a library, offices, &c. Dr. KANE was placed at the head of the institution, and one of the new eras of prosperity which are continually recurring in Ireland was supposed to have commenced. It cannot be said that the numerous professors, although able and eager, have done much towards developing the industrial resources of Ireland. They have delivered courses of lectures, completed elaborate experiments, awarded prizes, presented reports to Parliament, and what not, but it is acknowledged that the need of adequate or rather official instruction is more marked than ever. Englishmen and Scotchmen go over to Dublin and bring back with them the prizes of the College of Science. The competition is apparently not excessive, for according to the official returns some of the classes are attended by not more than a couple of students.

The indifference on the part of young Irishmen is not so culpable as it may appear at first sight. In the acquisition of knowledge for its own sake time is worthily employed, but for the majority something more is needed. It is expected to have a money value, and especially in a country where riches are not abundantly diffused. When it is known that manufacturers are seeking for assistants in colleges, schools or institutes, an impetus is given to study. In England and Scotland an announcement of the good fortune of former students is more persuasive than the most grandiloquent prospectus of a school or college. But in Ireland that class of intelligence is not forthcoming. The manufactories and commercial establishments which in Great Britain offer opportunities for skilled assistants are now absent from Ireland. KANE aided in their extinction. Belfast is supposed to be an exception, but even there the demand for practical science or art is not urgent. If in the forties Ireland was so far behind the rest of Europe that the dread of resembling it made the Belgian Chambers become unusually liberal in passing votes for education, the distance which separates it from continental countries has increased. It has stood still while the greater part of Europe was endeavouring to advance regardless of fatigue. Outsiders may be struck by the contrast, but to Irish traders the position is not unsatisfactory. They can obtain foreign goods which may be sold as native products at more moderate prices than before. One industry after another has succumbed before foreign competition. A few weeks since the distillers formed themselves into a defence association, because they found the Germanic Irish whisky was coming into favour. It could be bought at half a crown a dozen, and retailed at the same price as the Irish liquor, for which the grocers were expected to pay twelve times the amount. Publicans could accordingly make a fortune by the aid of foreign chemistry in a short time, and be able to devote their days to the patriotic duty of serving their country in Parliament and elsewhere. What is now occurring with intoxicants is no more than a repetition of the experience in other affairs. Irishmen, from their want of technical knowledge, are not competent to manufacture whiskey at a few pence per bottle, but foreign science has come to their aid, and so long as the stuff is bought from him at a price far beyond its value the shopkeeper is indifferent about the source from whence it came.

There are, however, a great many people who are not distributors in the political-economical sense, and are therefore envious when they see foreign manufactures everywhere in Ireland. Some of them, no doubt, suffer from the new invasion, and in consequence are unable to realise that an equivalent benefit is obtained by those who are in harmony with the new arrangements. They sought for the primary cause, and at last discovered it to be the incommodious College of Science. Judging by the class-lists that building appears to be too large, but suppose a great part of the population were resolved to discover how to distil whiskey at half a crown a dozen, where were the aspiring chemists to be accommodated? Moreover, in the present building pure science alone is said to form the curriculum, and as without adulterations profits are insignificant, the place was considered to be no longer in keeping with the spirit of the times. Accordingly an application was made to the Government to erect a new and more extensive college where practical operations on a large scale could be carried out.

It was not difficult to convince the Government about the existing College of Science being a failure. That was inevitable. The college was founded in a panic, and without any consultation with the representatives of Irish industries. The object of it was to compel manufacturers and others to employ immature students as experts. Experience was to succumb to paper certificates. The Govern-

ment accordingly resolved two years ago to meet the rising disaffection, and gain time by appointing a special committee to report about "what new buildings are required; whether they can be added to the existing college, or whether an entirely new site should be obtained; and, if the latter, where it should be, and what should be done with the existing college." Captain Abney, of the Science and Art Department, was appointed chairman, and the other members were a Commissioner of Valuation and a Treasury Remembrancer, forming as incongruous a combination as could be found in the records of official committees. The report has just appeared.

The instructions were not explicit—they rarely are in such inquiries—and the committee were soon made to feel they were in a false position. For to determine what buildings are required it was necessary to ascertain the purposes they are to subserve. Captain Abney, as a photographer, could not well consider anything which was without existence, the Valuer was in the same predicament, and although we do not know what a Remembrancer is, we suppose he also has some connection with realities. The hapless committee, therefore, turned for advice to various notabilities. They all differed about what was to be done, for their notions were as indefinite as the committee, but they were willing to see money expended liberally on buildings. Monsignor Molloy was of opinion that not only a Science College, but a new class of schools should be established in the larger towns, and afterwards in the smaller towns. He considered the intermediate schools should be first erected in order to provide students for the central college. In the latter he would begin by the equipment of a department of electrical engineering; he would allow the collection of physical apparatus to be used by teachers who were outsiders, and have a laboratory in which any qualified person could pursue investigations. But however large was the outlay, he considered the college would be unsuccessful "unless it is placed under a governing body known to the people of the country, in touch with the people and having the confidence of the people." That signified, of course, independence of Captain Abney and the Science and Art Department. Mr. T. P. Gill, "Hon. Sec. of the Recess Committee," another mysterious office, put forth a sum in proportion, viz. If in Stuttgart 100,000*l.* was expended on a polytechnic, and 120,000*l.* in Darmstadt and 450,000*l.* in Berlin, what should be the cost of the Dublin College of Science? On what lines the college was to be designed, and where set up, he declined to suggest; but he, too, was convinced that the Science and Art Department, "in undertaking the construction of this necessary college, will be but beginning a work which it will be the privilege of an Irish authority to finish, and securing for that Irish authority a building grant which will be absolutely essential to the carrying out of its mission."

That signifies that Home Rule will be granted soon after the commencement of the college, and that England will have the pleasure of paying for building experiments which are directed from the Parliament House in College Green. Professor G. F. Fitzgerald said "until the lines of technical education in Ireland have been laid down, it is impossible to decide upon the lines that will be suitable for the college," but he implored the committee to avoid following German examples. Professor M. F. Fitzgerald, as an opponent of centralisation, preferred colleges in Belfast and Cork, but if there must be one in Dublin "its management should pass out of the hands of the Science and Art Department, because that department was not organised or adapted to carry on the business of technical education, and should not, therefore, be called on to do so." The Dublin Chamber of Commerce also resolved "that the proposed new buildings in connection with the Science and Art Department should be under Irish control."

It was excusable for the committee to become bewildered amidst such a medley of opinions. All they could do was to report that for the proposed College of Science a site might be found by removing workshops and stores which stand on Government property near the Science and Art Museum and the Natural History Museum in Dublin, and by purchasing adjoining property in Upper Merrion Street. But they admit their incompetence to suggest the kind of building which is required. The following extract expresses their doubts:—

> Returning to the question, "What new buildings are required?" the difficulty which we feel in dealing with it is of a twofold kind. In the first place, it is doubtful whether we are expected to go into details which assume some professional knowledge, or whether we may content ourselves with a general expression of our opinion that the new college should be up to date in all particulars, and should suffice to provide for any developments which are likely to take place in the field of technical instruction. After much consideration we have arrived at the conclusion that, having regard to the constitution of the committee, we are not under the necessity of dealing with the question from the professional standpoint; while we feel that the expression of our opinion in the sense we have just stated will be quite sufficient for the purpose of a reply to the question. This course, moreover, recommends itself to us, because, by adopting it, we shall avoid the further difficulty, viz. that any plan or hint at a plan for the construction of the building, even though it should be only suggested for consideration, might at the outset provoke local opposition to the scheme, which it is desirable to avoid. The approval of a plan should, we think, be left open for consideration by a committee whose constitution would render the adoption of one best suited to the needs of the country more easy than would be the case if it were submitted as a cut-and-dry proposal by a committee whose qualifications for the task might be questioned.

We must applaud the committee for declining to assume any possession of professional knowledge. But the acknowledgment that a hint of a plan is sufficient to jeopardise the project reveals how indefinite are the proposals. The reason is that now, as half a century back, the authorities have gone to work in a wrong way. The Science Director, the Commissioner of Valuation and the Treasury Remembrancer are, we presume, useful servants of the State, but what can they know about Irish industries? Even if we allow their competence to be judges and to elicit information at an inquiry, they cannot have that personal knowledge which is needful in determining on a system of education. What should have been done was to obtain the opinion of representatives who are every day engaged in the industries of Ireland which have survived, or those which could be restored, and ascertain why in the industrial struggle they are not equal to British or foreign competitors. "There is nothing like leather" exactly describes the ideas of professors and specialists; each has his pet science which he would make paramount over all others. But what is needed is the discovery of the means which will compensate for evils that in a great measure are to be attributed to the teaching of professors who were never under the necessity of testing their theories by the simple formula, "Will they pay?"

SOME ESSEX CHURCHES.*

WHEN asked to read a paper upon "Essex Churches" I felt the task of condensing a subject so full of interest within the limit of a short paper would be a difficult one, so thought it better to confine my remarks to those in the neighbourhood of Colchester, much as I should like to have enlarged upon the interesting chapel of Great Peter on the Wall at Bradwell, and St. Andrew's at Ashingdon, the latter being the oldest church now existing in Essex, it being a good type of Anglo-Saxon work, with its walls 8 feet thick, having been built by Canute about the year 1010, at which time there was an immense revival of religious life all over Europe, in anticipation of the end of the world; so strong indeed was this belief that in all legal documents of the period the words, "The end of the world being near," were used as the concluding sentence.

Colchester is well known amongst archæologists as the ancient Camulodunum, the earliest Roman settlement of importance. History tells us that this ancient town played an important part in the days of Boadicea.

The town walls, evidently of Roman construction, are considered to be the best specimen left that we have in England, for while the masonry was not so perfect as in York, its full extent round the town was more intact. The Balkerne Gate is a good specimen of Roman work.

It is not my intention to dwell upon the fine old Norman castle of which Colchester is so justly proud, as my paper is on ecclesiastical buildings only, but I should strongly recommend

* A paper read before the Society of Architects, by Mr. G. Gard-Pye, on Thursday, May 25.

any member of the Society when in the neighbourhood to visit this old building, containing as it does some interesting herring-bone work, and old Norman fireplaces in a good state of preservation. A good number of the churches in Essex—and more so round Colchester—are of Norman origin, being restored or rebuilt later on in the Decorated and Perpendicular periods, more in the latter than the former.

St. Botolph's Priory, through being unfortunately between the fires of the besiegers and the besieged during the siege of Colchester in 1648, was reduced to its present ruinous state, and consisted of nave, central tower, transept and choir. This is a remarkable instance of the use made of Roman materials for building, and singularly enough these materials were used for the ornamental part, as can be seen in the west front. The bricks used were of the fourth century, and some even earlier. When the Royal Archæological Society visited this building in 1877 several members pointed out some bricks that were as early as the first century, being only 1 inch in thickness.

The west doorway is a good specimen of a Norman arch, with its zigzag or chevron, and billet mouldings, with a rude hood mould formed of tiles and the interlacing arches from which it is said the Gothic arch of later years took its form, but I think this is theory only.

The gateway is all that is left of the once large and handsome abbey, now known as St. John's Abbey Gate, dating from the time of Henry II., and has been very truthfully restored some years back by Major-General Montagu, Royal Engineers. Fortunately for him one of the pinnacles was discovered buried in a wall, and from this clue he was enabled to add the others.

In the priests' doorway in the ruins of St. Nicholas Church, at Colchester, you again see the introduction of Roman bricks re-used from some old building that had been pulled down. These ruins have given place to a new church that was designed by the late Sir Gilbert Scott.

A very interesting specimen of a Saxon doorway is in the tower of Holy Trinity Church, Colchester. Here we have another example of the introduction of Roman brick, and the primitive idea of ornament in the rude formation of the shaft, with cap and base, with the hood mould, and as a sign of the religious revival, the formation of the Cross in the key of the arch.

Ardleigh Church is a specimen of an ordinary Essex church, Perpendicular in style, with its tower, nave, aisles and chancel. The porch contains some fine work in flint and ashlar work.

I should like to add here that the churches of East Anglia are different from those in the West of England, though there is much Perpendicular in each, the style being largely ruled by the materials at the disposal of the builders. Here there was little stone to be obtained, and they had to use flint, with facings of fine stone, which is the characteristic treatment of the district.

Great Bromley Church is another good specimen of an Essex Perpendicular church. The nave roof is very elaborate, having double hammer-beams, richly carved and picked out in vermilion. This church stands in the beautiful vale of Dedham, was the subject of one of Constable's paintings, and was built by a father and his son whose marks still remain in the tower.

In this church, on the south side of the chancel, is an oven with flue complete, for the baking of sacred wafers, the only instance, I believe, in England of an oven in a church. The stairs to the rood loft still remain.

The north porch, the view shown, has a narthex or room over, used either for storing parish documents or as a library to store those books given to the parish, as in those days books were scarce, and such a gift was in consequence valuable. When these rooms had a fireplace in them and a window opening into the church they were usually used as watching rooms and chambers.

Lawford Church has an interesting group of chancel windows of an earlier period than are mostly to be found in this part of Essex. Internally are some elaborate stone carvings. It is of this church, but I will not vouch for the truth of it, that an amusing tale is told. It was many years ago the custom for the rector to wait until the squire of the hall adjoining had arrived before he began the service. One Sunday, being later than usual, the rector began with the usual opening sentence, "When the wicked man." The old clerk jumped up and said, "Please, sir, he baint come yet."

Higham. A specimen of a priest-door and chancel window.

Another fine Perpendicular church is at East Bergholt, with unfinished tower. The bells hang in a cage in the churchyard. There are several brasses and tombs in this church, and window to the memory of the painter Constable, who was born in this village, and here painted many of his pictures.

The north porch of Boxford Church is one of the oldest wooden porches in England unrestored. The south porch is stone, which must have been brought from some distance, as there are no quarries anywhere near. The ceiling is very handsomely groined. There is a good specimen of a Late Pe pendicular door richly carved and moulded, and also a ver handsome screen of stone in this church.

I ought to mention that this and the last two churches ar strictly speaking, not in Essex, but in Suffolk, but as they a just on the border of the two counties, and interesting, I hav included them.

Little Oakley Church contains a curious feature of a pries door being pierced in a buttress.

Great Bentley has a good specimen of a Norman door wit its zigzag and rose mouldings. There are several other Norma features in this church, including five windows. The staircas to the rood still exists.

Fingringhoe has a Perpendicular porch built in rubb work, finished with flint and stone in the parapet. In th spandrils are the Archangel Michael and the dragon, evident symbolical of heaven and hell, as the church is dedicated St. Andrew and not to St. Michael, as these figures would lea one to suppose. This church was considerably damaged b the earthquake in 1884 and has since been restored. Ther are some interesting frescoes, including one of St. Christophe carrying Christ over the river of the waters of life, and an ol oak chest richly carved.

Langenhoe Church was entirely destroyed in the earthqua of 1884, and has since been rebuilt.

Brightlingsea Church contains good specimens of Perpen dicular work, although it is clear that from the buttress leve with the chancel, which is of earlier date that the rest, that it a fourteenth-century church changed at the end of the fifteenth a regards the aisles, with battlements and the tower added. Th late Professor Freeman describes this tower as being one of th finest of its kind in existence.

Frating Church has an old oak porch with an open roof.

Berechurch is a curious old church prettily situated in park. It is difficult to account for the large window that ha been inserted.

The church at Copford was undoubtedly of Norman origin having a vaulted roof, but the destroying hand of time obliged the substitution of a wooden roof, which by archæologists i acknowledged to be a beautiful piece of work, and much admired by the late Sir Gilbert Scott. The walls, which ar very thick, were mostly built of Roman brick. The noted features of this church are its frescoes. In the apse Christ i represented seated on a throne with a rainbow behind, and clouds under His feet, His right hand in the attitude o benediction, and His left resting on a book, the wounds being visible in the hands and feet; below are angels, and in th background the towers of New Jerusalem. On each side stand four apostles under canopies. Excepting the chapel i Canterbury Cathedral, the late Sir Gilbert Scott said in hi whole experience he had never seen anything to compare with it. The south porch to the same church is considered by Si Gilbert Scott to be the most beautiful specimen of a Decorated wooden porch in the country. The door leading from the porch to the church was covered with the skin of a man who had been caught in the act of sacrilege.*

Close by are the famous towers of Layer Marney, with it terra-cotta work, but as it is a domestic building it is out of my province in this paper to describe it fully, but it is well worth of a visit should any member of the Society be in th neighbourhood.

Marks Tey is a thirteenth-century church, curious in it having the upper portion of tower of wood.

Great Tey Church is very interesting, with its Norma tower heightened at a later period. The plan of this churc was cruciform, the nave and chancel being rebuilt in the Earl English and Decorated periods.

The old wooden porch to Aldham Church is of th Decorated style, mentioned and illustrated by the late J. H Parker in his "Glossary of Gothic Architecture."

Bures Church, like that of Little Oakley, has the buttress the chancel pierced for the priest-door, another good specime of East Anglia Perpendicular work. The south porch is a goo specimen of a treatment in brick, but of course is of later da than the church itself.

Mount Bures Church is another specimen of a Norma tower, but heightened, as you will see, a few centuries later.

Coggeshall has a fine Perpendicular church of large pr portions, the interior being richly carved. It is the large church in Essex.

Little Maplestead was originally attached to the Recepto of the Knights of St. John of Jerusalem, founded here in th time of Henry I. Though restored in 1854, it is still of speci interest as being one of the four remaining round churches England, built on the model of the Holy Sepulchre; the othe being the Temple Church, London; St. Sepulchre, Northam ton; and St. Sepulchre, Cambridge. The chancel is an aps

* Since writing this paper a friend has kindly forwarded to me copy of the supplement to the *Tablet* of the May 13, in which th church is very fully described and illustrated by Mr. Dudley Baxter, B.

The nave circular, with peristyle of six clustered columns. The western entrance has quatrefoil border. This church is said to have had the privilege of sanctuary.

I have now completed my paper, but before I conclude I should like to thank my friend, Mr. John Bettison, a retired naval officer, who takes a great interest in photography, and who has kindly prepared the slides from the photographs I took myself when in my articles some thirty years ago, before the hand of the restoring architect had touched most of them.

In those times tanning dry plates were in vogue, ten minutes being considered an average exposure, and when taking interiors it was no uncommon thing to leave one's camera exposed all day and call for it the next, but photography like other sciences has of late made rapid progress, and the student of to-day is now able to take his "snap-shot" and be off to pastures new on his "bike." I prefer the slower method, as it enables the student to study more fully the details that are of interest on the spot, take his own sketches, the exact contour of the mouldings by means of his strip of lead, and then compare them leisurely at home with his photo, thus leaving a more lasting impression on his mind and laying a better foundation for his architectural success as a church architect in the future.

COBHAM, KENT.

By W. F. POTTER.

KENT, the hop-garden of England, was selected for the first summer excursion of the Architectural Association on Saturday, June 3, and the place chosen was Cobham. Fortunately for those who attended, but unfortunately for those who did not attend, the number was limited to thirty, but somehow, as the stonecutter wrote over the grave of Old Moore in Bexley Churchyard, I made the "31th." The party, under the guidance of Mr. G. H. Fellowes Prynne, president, and Messrs. Aldwinckle and G. A. Lansdown, who acted as "showmen," alighted at Sole Street railway station, and after a pleasant walk through the hop gardens made their way to the old Leather Bottle inn, of Pickwick fame. Having partaken of luncheon and signed the visitors' book—which is an interesting document, by the way, containing sketches and signatures of all sorts and conditions of men, from Mr. J. L. Toole, Mr. Walter Crane and others, down to your humble servant—Cobham Church was first visited. It is dedicated to St. Mary Magdalene, and from an illustration of the piscina in Parker's "Glossary of Architecture" it is ascribed to A.D. 1490. This church is well known to all archæologists as containing the finest and most complete set of brasses in England, and for an account of them we would refer our readers to Mr. Waller's essay, "The Lords of Cobham," published in "Archæologia Cantiana," vol. xi. In the *Gentleman's Magazine* for March 1841 we observe:—"We have the gratification to notice a very laudable work of repair which has been executed upon the sepulchral memorials of one of our most distinguished baronial families, at the expense of a descendant and inheritor of their name, though not of their estates. We allude to those contained in the magnificent chancel of Cobham Church, which, since the fatal ruin of the family in the reign of James I., and the consequent transfer of their domains to the houses of Lennox and Darnley, have been entirely left to the devastating tooth of time. Those who are acquainted with sepulchral brasses generally are aware that this is the richest assemblage anywhere to be seen on one floor. They had suffered considerably from the decay of the ledger slabs of Purbeck marble within which they were set. These slabs (with one perfect exception) have now been entirely refaced with mastic, which has given them the appearance of new stones, and thereby the brasses, which were in many cases loose, have been immovably refixed. All the smaller pieces, which had become detached and were lying either in the parish chest or elsewhere in the church, have been restored to their places and the matrices of the lost pieces have been carefully indicated by a metallic colouring. The fine Elizabethan table monument in the centre of the chancel, which bears the effigies of George, Lord Cobham, and his lady, has also been considerably repaired; the loose portions of its superincumbent structure have been fixed; the Ionic pillars round the tomb, which were all broken, have been renewed, and the figures of the fourteen children, which were all displaced and mostly broken into shapeless limbs and torsos, have been very neatly and ingeniously restored." Cobham College was next visited; this was erected by John, third Baron Cobham, who was called "John the Founder" because he founded this ancient and picturesque college; it stands behind the church, with its curious high chimney-stacks, red tile roof, and ivy-covered walls yellow grey with extreme old age. It is not a college now but a hospital, sheltering numerous ancient pensioners. This Lord Cobham also greatly rebuilt and adorned Cobham Church; he built Cowling Castle not far off for the defence of the county, and joined with Sir Robert Knollys in the construction of Rochester Bridge. He is described as a liberal-minded, patriotic, and a brave and independent man, who was sent by King Edward III. as ambassador to Rome, and during a life of over ninety years he was constantly employed for the good of his country. (*Vide* Mr. Waller's "Lords of Cobham," aforesaid.)

At 4 P.M. the members walked to Cobham Hall, which is also mentioned in Parker's "Glossary," and is the seat of the Earl of Darnley. This is a large Tudor mansion planned in the form of a block letter H; the cross bar of the letter was, however, built for the Duke of Lennox from a design by Inigo Jones, partly on the remains of an earlier house. The interior of this portion of the mansion contains the Gilt Hall, which is used as a music-hall, and when it was visited by King George IV. he called it "the finest room in England." It is certainly of very lofty and good proportions; the lower walls are of polished white marble, relieved by sienna marble pilasters, the upper portions being ornamented with gilded scroll-work. At one end of the room is the organ, below which is raised a gallery for the music performers. Above the mantelpiece are representations of a shepherd, nymph, and a bas-relief of Aurora by Sir Richard Westmacott. The vestibule is filled with costly vases, and the picture gallery, 136 feet long by 24 feet wide, contains numerous masterpieces. King Charles I. and his bride, Queen Henrietta Maria, slept here on their way to London after their marriage at Canterbury. A few years later, in 1643, the Roundhead troopers were masters of Cobham Hall, which they thoroughly despoiled. For an account of the great Cobham family and the subsequent owners of Cobham Hall we must refer our readers to Hasted's "History of Kent." Having spent a pleasant hour in this mansion and park, with its fine specimens of rhododendrons, and which was to be thrown open to the public on the following day, the members returned to the Leather Bottle to tea, and by 6.15 P.M. train to London.

THE BRITISH SCHOOL AT ATHENS.

THE Athens correspondent of the *Times* telegraphs, under date May 25:—An interesting archæological discovery has just been made at Pilaf Tepe, in Thessaly, by Mr. Douglas Edmonds, a member of the British school at Athens. While excavating a tumulus commanding a position above Velestino, the ancient Pheræ, Mr. Edmonds brought to light a tomb in which, besides a few gold fillets and other objects, was a large well-preserved silver vase of Hellenistic date containing human remains. The British school has had an exceptionally successful season. The excavations at Naukratis, in the Egyptian Delta, resumed after thirteen years, have resulted in the definite discovery of the great Hellenium, or common sanctuary of Asiatic Greeks, described by Herodotus. In this were found a fine series of terra-cottas and many inscriptions. At Phylakopi Melos, where excavations have now been carried on for three seasons, there was found a complete Mycenæan palace with women's apartments detached. The streets and general plan of Mycenæan and pro-Mycenæan settlements have been greatly elucidated. Excavations are still proceeding.

The British school, in conjunction with the Cretan Exploration Fund, has also secured large concessions in Crete, where it is hoped work will be begun early next year.

THE BRITISH ASSOCIATION.

ARRANGEMENTS for the visit of the British Association to Dover this year are making good progress. The committees are actively at work, and in response to the appeal of the hospitality committees over 1,500*l.* has already been subscribed. In connection with the visit an instructive address was delivered by Sir John Evans on the Association's objects. The Bishop of Dover presided. The president of the Dover meeting will be Professor Michael Foster, and the presidents of the various sections are to be:—Mathematical and physical science, Professor J. H. Poynting; chemistry, Mr. Horace T. Brown; geology, Sir Archibald Geikie; zoology, Mr. Adam Sedgwick; geography, Sir John Murray; economical science, Mr. Henry Higgs; mechanical science, Sir William White; anthropology, Mr. C. H. Read; physiology, Mr. J. N. Langley; botany, Sir George King. Sir John Evans stated that there will be an exchange of visits between the British Association and the French Association holding its annual assembly at Boulogne. The Belgian Geological Society will visit Dover during the meeting.

The Ripon City Council are desirous to acquire Aldfield Spa, which yields sulphurous water, and have asked for plans and estimates of the cost of bringing the water to Ripon and the erection of the necessary baths and other buildings.

NOTES AND COMMENTS.

THE International Exhibition in Paris next year will interfere with the Salon, but there is no reason why the big display of pictures and statues should supersede the annual show which has become an institution. The subject has, however, presented many difficulties, and no little diplomacy was needed to secure an arrangement. What has been done will not please all artists, and the constant visitors will not look forward with satisfaction to the prospect of journeying to a region so remote from the Champs-Élysées as the site of the ancient abattoirs at Grenelle. It can be said in its favour that it stands near the military quartier, and the journey can be broken by a visit to the exhibition in the Champ-de-Mars. But it will require something more than a love of art to persuade the ordinary Parisian to go so far. It cannot be determined at present when the temporary Salon shall be opened. The buildings will also be required for exhibitions of horses and cattle. The representatives of the sections must arrive at an understanding about the dates, and compromises will have to take place. What is satisfactory is that many French artists need no longer despair about selling their works in 1900. The authorities of the two societies are willing to work amicably together to secure an interesting exhibition.

AMONG the subjects for speculation at the present time in Paris is whether MONTJARRET will conduct the President's cortège on the visit to the Longchamps race-course for the Grand Prix on Sunday. What the City Marshal is to those who are ruled from the Guildhall, that cavalier is and more. According to the current belief, he is an Englishman, like all who hold responsible positions in the equine world of France. But if a foreigner, he has, like the great NAPOLEON, become an idol to the Parisians. The late General BOULANGER'S horsemanship was considered to be undignified when compared with MONTJARRET'S, for the equerry appears in the saddle as august a being as a king on his throne. Unfortunately, MONTJARRET has met with an accident, and in the most unlikely place—a painter's studio. M. GEORGES BECKER having been commissioned to paint the departure of the Czar of Russia and his spouse from the Hôtel de Ville, there are introduced in his work all the foremost notabilities of France. But the most difficult of all to treat was MONTJARRET. The least failure to express the bewitching horsemanship of the state equestrian would at once be detected by every Paris *gamin*, and the picture it was feared must be relegated to obscurity. MONTJARRET resolved to come to M. BECKER'S aid. He condescended to mount the lay horse and to appear as when he was supreme at the historic event. But MONTJARRET is not familiar with the ways of wooden chargers. He tumbled in endeavouring to dismount, and the question is, Can the surgeons restore him to a condition which will enable him to represent the majesty of France in a style which LOUIS XIV. might envy?

IN 1850 the explorations of Mr. LOFTUS suggested the great interest of Susa as a place for archæological investigations. He was able to suggest that in the palace were a central hall with thirty-six columns, and three porticoes of twelve columns, but in the public estimation the architectural fragments were of less interest than the enamelled frieze which M. and Mme. DIEULAFOY unearthed, and which is to be seen in the Louvre. The French resolved to keep their hold on so productive a spot. An agreement was entered into which conferred the sole right of archæological search in every part of Persia to the French Government on condition that precious metal and stones and half of other relics are surrendered to the Persian Government.

A CORRESPONDENT of the *Times* considers that without interfering with the French an arrangement could be made with Persia. He says:—"The relics are packed and sent to Teheran, where the shares for each Government are made out. The Persian 'half of the discoveries' will be probably sold to the local dealers in antiquities, and science will be this much the poorer, for every relic excavated from the mound of Susa will supply most interesting *data*, and will carry us back to times that were contemporary with the first civilised occupation of ancient Egypt. Already the members of the Délégation have discovered the names of eleven kings of Susa, at present utterly unknown to history and also a new cruciform inscription which the Rev. PÈRE SCHEIL, the eminent Assyriologist, is at present deciphering. Some beautiful specimens of the Flint Age, in the shape of axe, spear and arrow heads, have also been discovered—and all this in two consecutive cold seasons." If a national museum existed anywhere in Persia it would be right to have as many as possible of the relics deposited in it, but when they are likely to be spread throughout the world and to be imitated nobody could object to negotiations by the British Government. But the Germans have probably anticipated us.

ILLUSTRATIONS.

CATHEDRAL SERIES.—ROCHESTER: THE CHOIR.

THE EMPIRE PALACE OF VARIETIES, MIDDLESBROUGH.—INTERIOR SHOWING HALF THE STAGE AND BOXES.—EXTERIOR.—INTERIOR SHOWING PROMENADE.

THE site selected for the building covers an area of upwards of 11,000 square feet, having frontages on three sides to Corporation Road, Pine and Dunning Streets, and a frontage to a right-of-way in the rear, thus being practically isolated. The main approach is from Corporation Road through a handsome hall, 34 feet by 19 feet and 18 feet in height, having a large recessed fireplace. At the left-hand side upon entering is the box office, adjoining which is the staircase to the stalls, whilst on the right is a broad staircase leading to the grand circle; in addition there are two emergency exits from the stalls into Dunning and Pine Streets, and an emergency exit staircase from the grand circle into the former thoroughfare. The pit entrance is from and on a level with Dunning Street, with an emergency exit opposite directly into Pine Street, whilst the gallery entrance is from the latter street, with an emergency exit into Dunning Street. The auditorium is nearly square, being 60 feet in width, 63 feet deep, and the average height to false ceiling 45 feet. The area comprises 120 orchestra stalls, 120 stalls, and a pit with a seating accommodation of about 450. Spacious saloon accommodation is provided. The grand circle has seating accommodation for 150 persons with ample lounges; immediately in the rear over the entrance hall is the principal saloon, 34 feet by 27 feet, approached by two short flights of steps, thus enabling a clear view of the stage to be obtained. A further saloon is also provided on the Dunning Street frontage. Both the entrance and exit staircases terminate in roomy lobbies, and there are communication staircases directly into the stalls from either side. Four private boxes flank the proscenium, and on the gallery level are two private boxes. The gallery itself has seating accommodation for 750 persons, and a suitable saloon is provided in the rear. The ceiling, proscenium, circle and box fronts are in specially designed and modelled plastic work, following, in a degree, the Spanish Renaissance treatment of the exterior. The ceiling is painted with allegorical subjects. The principal seats are of the tip-up pattern and upholstered in velvet, and the pit seats upholstered in leather. The stage and its accessories are roomy and will permit of spectacular productions of all kinds. Its dimensions are as follows:—Width from wall to wall, 70 feet; average depth, 35 feet; height to flies, 25 feet; height to grid, 55 feet; proscenium opening, 30 feet square. Six spacious dressing-rooms are provided entirely distinct from the stage and in a separate block, each room being fitted up in the most approved manner; the stage entrance is from Dunning Street, and the scenery entrance in the rear of the building.

Messrs. ERNEST RUNTZ & Co. are the architects.

The original picture of the building was exhibited in the Royal Academy in 1897.

SUMMER HOLIDAYS AMONG FRENCH CATHEDRALS.

By the Author of "Ecclesiologia Germanica," &c.

(*Continued from page* 356.)

XXII.

Gournay—St. Germer—Beauvais.

ONE of the most delightful of my ecclesiological tours in France was that made a few years ago among the *crême-de-la-crême* of Northern Pointed architecture — the cathedrals and churches of the Isle of France, Picardy, the Soissonaise and French Flanders. Briefly, the route taken was as follows. Entering Normandy at Dieppe, I proceeded thence *viâ* Neuchâtel-en-Bray, Gournay and St. Germer to Beauvais. From there I went to Creil, making that railway centre the *point du départ* for Senlis, Compiegne and Noyon. Returning to Creil, I journeyed, partly on foot, partly by rail, to Paris, visiting in a leisurely fashion several of that noble line of village churches—St. Leu d'Esserent, Champagne, Pontoise and Auvers—with which the banks of the Oise are so plentifully studded. Arrived at Paris, I proceeded from the Gare du Nord to that of L'Est, and in a short time found myself at Meaux. Thence I proceeded to Rheims, returning home *viâ* Laon, Soissons, Cambrai, Lille and St. Omer, after a tour which had comprehended not a few of the most interesting and important of the buildings reared under the sway of St. Louis and Philip Augustus.

It was certainly a novel experience, the finding oneself dropped from the train at a quarter-past seven o'clock on a Sunday morning just as the bells from the picturesquely unfinished steeple of the church at Neuchâtel-en-Bray were calling folks to early mass.

Leaving town on the evening of a Saturday, I reached Dieppe at four o'clock on the next morning to find its streets untenanted save by sundry cats, who, from their dissipated appearance, had been holding festival all night. Entering Dieppe at this early hour the familiar sights and sounds were, of course, not in evidence.

The pier had not its complement of elegantly dressed and parasoled ladies telegraphing to their friends on board, and waving their handkerchiefs at the vessel as though they were lusting it at a distance. Neither did I hear the shrill cries of hawkers, nor the plaintive pipe of the vendor of goats' milk as he traversed the stony streets with his long-haired flock. But a certain solemnity invested the steamer's gliding into the smooth water of the harbour between the two great crucifixes at this July Sunday daybreak, when even the noises—without which the French can do nothing—in and about the Douane seemed set an octave lower than at other times. All the still-life of the place—not forgetting the smells, which were, if anything, more emphasised than usual—was, of course, just the same.

There were the great white cliffs, along whose summits glorious walks, with a cobalt sky above and a sapphire sea below, had in former years been taken. Upon the eastern range stood that melancholy votive church, looking, if possible, more wretched than ever, and reminding one of the church a Chinaman, taken away from his laborious studies of pagodas, might be expected to produce after two months' study of the plates in Winkle's "Cathedrals."

There, westwards, was the lace-like tower and quaint central slate cupola of St. Jacques, whose "peaceful gates" even at this early hour expanded to all. Further on and I arrived at St. Remi, in one of whose straight-backed, doored pews—having an hour or so to spare before a train could be got on to Neuchâtel—I ensconced myself; and here a ludicrous incident would force itself upon the memory.

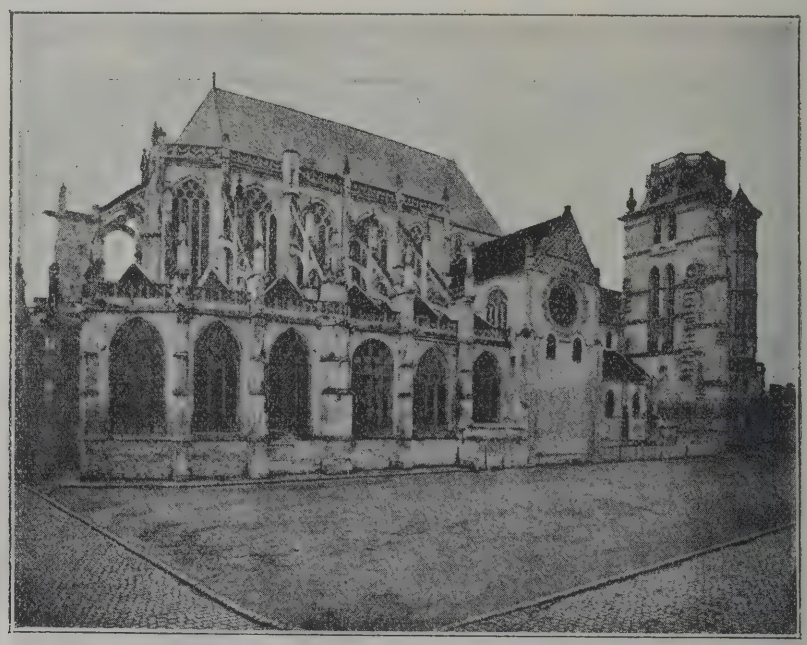
One Sunday, a year previously, I had chanced to stroll into this quaintest of old Normandy churches just as High Mass was concluding.

While the "sortie" was being played upon the fine-looking organ at the west end of the church the *enfants du chœur* were,

St. Germer, near Gournay: South Side of Sainte Chapelle.

prior to dismissal, drawn up in double file in the centre of the spacious choir, and a very picturesque group they formed with the surroundings.

One of the urchins was being reproved by the *magister choralis* for some delinquency or other, so upon dismissal he in revenge "took a sight" at the learned gentleman, and with such an air of cool bravado, that the sacredness of the place forced me to endure that most unpleasant of sensations—suppressed laughter.



On the same occasion—the scarlet cassocked and albed flock having taken their departure—it was not a little diverting to observe the stony gaze with which some soldiers, waiting for the Messe du Midi, regarded the books handed to them by the sacristan much in the same manner as I have observed the godfathers and godmothers in "the humbler walks of life" do at baptisms among ourselves.

Repairing to the railway terminus, I took my ticket for Neuchâtel, *en route* for Gournay and Beauvais; and the train, after rushing through the pretty pastoral Pays du Bray, where orchards lined the rail almost without intermission, deposited me, as I have said above, at a quarter past seven on the platform of the station of Neuchâtel. During the ride thither it had been pleasant to hear called out once more in Norman-

French the names of the stations—Rouxmenil, Arques-la-Bataille, and so on, with a dwelling on the ultimate.

Breakfast having been partaken of, and some slight adjustments of the toilette effected, I strolled up the little town of Neuchâtel to its parish church, which occupies a commanding situation at the top of the principal street, down whose kennels water was rushing in copious streams. A tolerably well-attended Low Mass being then in progress, I was constrained to defer my inspection of the church's interior to a more favourable opportunity. However, in strolling about the roads surrounding the town, with their fringe of fruit-laden orchards, the intervening time passed pleasantly enough.

The eastern portion of the church at Neuchâtel is fine Early Pointed, but the "restorer" has perhaps done mischief more tragic than utter ruin. Inside, the choir has a noble arcade of thick cylindrical columns with stiff-leafed capitals, a simple triforium of trefoiled arcades, and a lofty clerestory with windows composed of two uncusped compartments apiece, and with tracery formed of three trefoils. M. Didron's stained-glass, which fills all these windows, is brilliant but ineffective at a distance, from the absence of that important factor, grisaille, to give proper definition to the full-length effigies therein depicted. Like many of the Burgundian examples I had seen, the apse of Neuchâtel church was destitute of procession path, but the

BEAUVAIS: NORTH-EAST VIEW OF ST. ETIENNE.

three tiers of windows lighting it give this portion of the building an air of great luminosity. The arches opening into what were originally north and south transepts appeared to be Transition, but the tower which they support is only just distinguishable externally, for when the present western steeple was built it seems to have been much tampered with, having been removed down to the clerestory and roofed over in the same line as the choir and the nave. This last is a wretched perpetration of the Late Flamboyant age, with thick clumsy pillars in feeble imitation of those in the choir, and with beggarly roofs to the aisles. But the western steeple is, despite its late date and in the unrestored condition in which I saw it five years ago, a picture. I remember particularly a lovely piece of reticulated tracery in the tympanum of the west door, to touch which would be madness. The tower proper is surmounted by another very low one of slate, capped with a spire having pinnacles at its base of the same material, the whole helping to compose a really delightful group on this clear August morning.

Looked at from a ritualistic point of view, the morning at Neuchâtel could not, on the whole, be pronounced a success, however interesting it may have been architecturally. Indeed, had I not been prepossessed by the aspect of its tower a year previously during the journey from Dieppe to Beauvais, I should not have broken it here on the present occasion, for both the music at the Parish Mass and the vestments of the officiating clergy were of the most wretched description. A High Celebration at St. Alban's, Holborn, St. Mary Magdalene's, Paddington, or St. Matthias, Stoke Newington, has created far more impression.

Neither Gournay nor the neighbouring St. Germer should be overlooked by the visitor to this delightful part of Normandy—the Pays du Bray. The former has a collegiate church dedicated to St. Hildevert, of much dignity and interest, but from whose exterior restoration has exiled much that was once picturesque. The thirteenth-century façade with its triplet of lancets has suffered grievously, but fortunately the two western towers with their quaint louvres and hipped gabled roofs have not been transformed, and I gladly recognised my old friends again from Cotman's illustration of them in Dawson Turner's "Normandy." The interior has a Romanesque arcade of great richness, reminding me very forcibly of our Anglo-Norman work, and the upper parts, especially the vaulting, are fine. The east end terminates square, being lighted by a large Geometrically traceried window.

During my inspection a baptism took place at the font in the south transept. The child, at whom an old woman seated near me made minatory gestures, rent the air with its cries; two young ladies, presumably acting as sponsors, were paying more attention to one another's hats than the ceremony; and upon the withdrawal of the party to the sacristy for registering purposes, the aforesaid old woman made signs to me indicative of a desire to administer a little wholesome correction on Mrs MacStinger's system to the offending infant.

The three great bells in one of St. Hildevert's towers was booming out on the drowsy atmosphere, summoning folks to Vespers when I once more sought the train. Resuming the journey to Beauvais, the next station passed was St. Germer-en-Fly, whence a pleasant walk through English-like country lanes brings you to the great quondam abbatial church of that saint, but which time forbad my revisiting on this occasion. The nave, transepts and choir are Transitional from Romanesque to Pointed, with a few later insertions, but the Sainte Chapelle, whose plan, disposition and general arrangement appear to be nearly identical with the destroyed one of St Germain des Près at Paris, belongs to the age of St. Louis. To the same architect, Pierre de Montereau, is due the existing Sainte Chapelle at Paris, which from its elevation upon an undercroft is invested with a more *élancée* air than this of St Germer. Montereau died in 1266, and there is every reason to believe that in this graceful creation of the Early Complete Gothic style at St. Germer we have another design by the same hand—for it was built before his death and is identical in many features with work known to be his. A low cloistered

passage, whose window tracery and foliaged ornament deserve careful study, connects the Sainte Chapelle with the circumambient aisle of the abbey church. In the chapel proper the trefoliation of the inner arches of the windows, the easternmost of which are filled with coeval stained-glass, while the side ones are simply diapered, forms a strikingly graceful feature. Here again the "restorer" has laid too heavy a hand.

It was a charming railway ride on that golden August Sunday evening from Gournay to Beauvais, and grandly the great grey mass of the "tall man on tiptoe," with its forest of flying buttresses, and the familiar outline of its south transept, rose up against the opal-tinted sky, as the train made almost the circuit of its little city.

Although two visits had been paid to Beauvais, it was still pleasurable on this Sunday evening not only to make the acquaintance of its hitherto unexplored byways, the gigantic apse bursting upon the view every now and again with electrical suddenness, but to remark the quiet manner in which the people were walking about enjoying the Sunday evening calm, and affording a marked contrast to the noisy vulgarity too often witnessed on the same occasion in the streets of an English cathedral city.

A strong popular delusion has elevated the naveless cathedral of Beauvais into its great attraction. This must

North Doorway, St. Etienne, Beauvais.

be protested against, not because it is not very wonderful and awe-inspiring—it is both—but because its worship leads people to overlook or only to half see and understand the extreme value of Beauvais' other church, St. Etienne, to which—the cathedral being closed for the night—I devoted my attention this Sunday evening.

It presents a Romanesque nave and transepts of great beauty; but upon these portions, as is too frequently the case in France, a coarse choir of the Flamboyant has been rudely engrafted.

Unfortunately its western façade—a graceful specimen of the lancet epoch—is difficult to be viewed from a distance. As the illustration shows, it has a grand arched doorway. Within the tympanum are sculptures of the Nativity, the Epiphany and the Coronation of the Virgin, besides four rows of angelic and other figures composing the mouldings of its arch.

The jambs and central pier have lost their effigies and shafts, and the whole work is much mutilated, yet of its kind this western portal of St. Etienne is the best and purest piece of work in Beauvais, as far as goodness of sculpture and detail can make a work good. A triplet of lancets surmounts the gable, and a heavy unfinished tower of the Flamboyant period terminating abruptly in a low balustraded octagon, decidedly Classical, flanks the façade on the north. Our general view of St. Etienne shows it from the north-east, whence the mass presents a singular but not unpicturesque grouping of parts. Nearest to us is the lofty choir, evidently a poor imitation of the Flamboyant portions of the cathedral, its tall clerestory windows, whose lights and tracery retain a considerable quantity of sixteenth-century glass, being mostly destitute of cusping or foliation. Next we have presented to us the Romanesque northern transept, in whose gable is that delicate trellis-work, so extolled by M. Viollet-le-Duc. Outside the label of the rose window lighting the façade of this transept is a band of figures, doubtless representing the Wheel of Fortune.

Above the roof-line of the transepts and nave is seen a low central tower, with small lancet windows; but since the addition of the much loftier Flamboyant choir, it appears now only to be a prolongation of that limb westward, the sixteenth-century architect, whoever he was, having carried the apices of his clerestory windows up to the level of those in the tower. It will be remembered that a somewhat similar instance of this absorption of Early into Late work confronted us in the church at Neuchâtel.

The nave of St. Etienne at Beauvais has a low clerestory of round-headed windows, and the buttresses of its aisles are good examples of Late Romanesque work; but the external gem of this church is the doorway in the northern aisle—a very ornate specimen of the Round-arched style, and of which I was unable to resist furnishing an illustration. Above the richly moulded doorways is a triplet of semicircular arcades whose wall surface is diapered with a pattern sunk in the stone and marked at regular intervals by red tiles inlaid, and I should think about two inches square. Presumably this is a restoration; but at any rate, as a specimen of externally applied natural polychromy it is particularly grateful and refreshing to the eye. There is no service in French churches as a rule on Sunday evening, but on this occasion at St. Etienne a very pretty procession *aux cierges*, in connection with some guild or other, contributed not only to the "setting off" of the rich Romanesque architecture of the nave, but served to make the evening pass very agreeably and, I trust, profitably.

(*To be continued.*)

SUTTON PLACE, SURREY.*

THE earliest mention of Sutton to which interest attaches is that King Edward the Confessor had a hunting lodge near. Mr. Frederic Harrison is of opinion that the site of this was in what is now called Manor field, where some remains of an ancient structure have been found. It was, no doubt, as a memorial of this connection that the founder of Sutton Place dedicated his family chapel to St. Edward.

According to Domesday Book the manor of Sudtone was of the yearly value of 8*l.*, supported 16 villeins and bondmen, possessed a mill of 5*s.* yearly rental, a wood that supported 25 swine, &c. Several hides and carucates as usual.

William I. bestowed Sutton upon Robert Malet, whose father, William Malet, had been one of the Conqueror's favourite knights. At the fateful battle of Hastings William Malet was one of the knights (six in number, I think) who were told off to defend the consecrated banner of the Norman army, and after the battle he had charge of the sepulture of Harold at Waltham Abbey. His son, Robert, did not remain in undisturbed possession of Sutton. At the death of William Rufus he supported the claims of Robert of Normandy to the throne of England, and on the accession of Henry I. his manor was consequently forfeited to the Crown. This was the beginning of a very unsettled era of about four centuries for the Manor of Sutton, which, during that period, seems to have brought ill luck to its possessors. "From the Conquest to Bosworth field," says Mr. Harrison, "it was forfeited to the Crown more than ten times. At least ten times the owner or his heir is either beheaded, attainted, or killed in civil war." It was held, amongst others, by William, Earl of Warren; Lord Basset; Roger Bigod, Earl of Norfolk; Edmund, of Woodstock; Roger Mortimer, Earl of March; Joan, the Fair

* A paper read by Mr. Jonathan Downes at the visit of members of the Upper Norwood Athenæum.

Maid of Kent; and Earl Somerset, son of "old John of Gaunt, time-honoured Lancaster."

It is only natural to find that the estate had not improved since the Domesday survey under these conditions. In 1353 it was valued in inquisition when the Fair Maid of Kent inherited, and, apart from the land itself, the only structures standing thereon are scheduled thus:—

	£	s.	d.
No. 1.—A ruinous messuage after reprisals at .	0	0	0
No. 2.—A dovecote entirely ruined, as appears on view of same	0	0	0

Margaret, Countess of Richmond, mother of Henry VII., was the next possessor, and from her it descended to the Crown. Henry VIII., by letters patent dated May 17, 1521, granted Sutton Manor and its appurtenances to Sir Richard Weston, Knight, to hold by fealty with rents, issues and profits and right of free warren within the forest. By further letters patent of May 25, 1530, the king granted to Sir Richard licenses to impark 600 acres land and pasture, 50 acres wood, and 400 acres heath and furze. From the grant of 1521 to the present time—now nearly four centuries—the manor has been held by Sir Richard Weston's descendants and collaterals; since 1782 by Westons from an allied branch of the same family. The family of Westons, although not of noble rank nor one of the great houses, was an ancient county family of Lincolnshire since, at any rate, the time of Henry I., and probably earlier. Although ordinary history does not say much of Sir Richard Weston, the State papers of the time, says Mr. Harrison, are full of his name, and the list of offices held by him would fill pages. He was a gentleman of the Privy Chamber, appointed thereto by reason of his staid demeanour and discreet behaviour, and was also "Soldier, Seaman, Ambassador, Governor, Treasurer, Privy Councillor, Judge of the Court of Wards and of the Star Chamber."

His younger brother, Sir William Weston, was also a man of some distinction. In succession to his uncle, named John, who was Prior from 1477 to 1485, he had the sad distinction of being the last Prior of the House of Knights Hospitallers of St. John of Jerusalem at Clerkenwell. This distinction was conferred upon him in recognition of the active part he took in the heroic defence of Rhodes by the great Crusader, Sir Villier de Lisle Adam, from June to December 1522, against the siege conducted by Solyman the Magnificent, which was at last crowned with success. It was at this time that Sir Wm. Weston commanded the first ironclad recorded in history. She was called the *Great Carrack*, and was sheathed with metal so as to be perfectly cannon-proof. It is said that he died of grief on May 7, 1540, the date of passing the Act for the Dissolution of Religious Houses. He was buried with great state at the church of St. James, Clerkenwell. At the demolition of this church in 1788, his tomb was desecrated and destroyed; and Pennant, the antiquary, who saw and measured the skeleton, reports it to be that of a well-grown man 5 feet 11 inches in stature. His portrait still exists in the Royal collection of pictures at Windsor Castle. But to return to the elder brother, Sir Richard Weston, the builder of Sutton Place. He was born about 1485-86; married Anne, daughter of Oliver Sands, of Shere, by whom he had a son Francis, born 1511, whose sad fate we shall shortly hear.

I cannot, had I skill and knowledge necessary, attempt within the limits of this paper anything like a detailed description of the beautiful manor-house we have seen to-day. With one exception it stands to-day as it left the hands of Sir Richard's architect. When finished the quadrangle was completed by a northern wing, the centre of which was a gatehouse tower having two octagonal turrets at the angles—a somewhat similar design to the gate-tower at Hampton Court and Layer Marney, which, with Christ Church, Oxford, and Trinity College, Cambridge, were contemporary with Sutton Place. It is probable that this wing was damaged by the fire which took place on August 7, 1560, three days after Queen Elizabeth slept here; at all events, Brayley records that the entrance-gate had become ruinous and dilapidated, and was pulled down in 1786 by J. Webb-Weston. Mr. Harrison says this house is "almost contemporary with the exquisite chateaux of the age of Francis still preserved on 'the Loire.'" He calls it "a Cinque-Cento conception in an English Gothic frame, the single extant production of a peculiar and suggestive type of Renascence Gothic."

It is one of the few English buildings made of terra-cotta and brick without any dressing of stone. From its building till to-day it has remained in the hands of the same family—a family debarred for the greater portion of the period that has elapsed, by its adherence to the old faith, from taking any active part in the world of affairs.

To these conditions is no doubt due the fact that the house is unchanged in its aspect. It displays—I quote Mr. Harrison again—"not a record of the caprice, the ambition, the decay or the bad taste of successive generations. No Elizabethan architect has added a Classical porch. No Jacobean magnate has thrown out a ponderous wing with fantastic gables and profusion of scrolls. No Georgian squire has turned it into a miniature Blenheim, or consulted his comfort by adding a square barrack."

Another distinction of Sutton Place is that it is "one of the earliest mansion houses built only as a peaceful dwelling and entirely without any thought of defence."

Among Sir Richard's many offices we are told that from his character as a discreet reputable man of good standing he held during his busy life many wardships. In 1519 one of his wards was Wm. Lytton of Knebworth. Another was Anne, daughter of Sir Christopher Pickering, whom he married to his son Francis, about 1530, and the issue of this marriage was one son, Henry, who succeeded his grandfather Sir Richard—the first Sir Richard I would now call him.

Young Sir Francis—for he was knighted at the coronation of Anne Boleyn—seems to have been a gay, gallant young courtier, active and alert in all manly sports and pastimes, and I am afraid we shall find that he was somewhat fond of gambling.

Mr. Harrison has found a record that on one occasion he won from the king at one sitting, by play with dice, 46*l.*, which is equal to 550*l.* at the present day.

This intimacy between Sir Francis and the king is also shown by the fact that the king's wedding present to the young bridegroom is set down in the Court accounts as 6*l.* 13*s.* 6*d.* or 80*l.* of our money. It would be interesting to know what form this present took, whether cash or piece of plate. But this season of pleasant disport in the sunshine of the royal presence did not long continue. It had a sudden and tragic close. When in 1536 Anne Boleyn was charged with conducting intrigues with several young courtiers, Sir Francis Weston was unfortunately one of the persons implicated.

How far the unhappy queen was really guilty it is hard to say, but there seems little doubt that she displayed great freedom of manner to the young gallants with whom she was fond of flirting. For instance, it is said that when Weston avowed his love she boxed his ears, which does not exactly seem to our minds a queenly method of repulsing a dishonourable proposal. This is, perhaps, the episode alluded to in the following letter to Cromwell, the king's secretary, from Sir Wm. Kingston, in whose custody the queen was placed:—

"Sir,—Syns the makynge of thys letter the queen spake of Weston. Had spoke to hym because he dyd love hyr kynswoman, Mrs. Skelton and not hys wyf, and he made answer to hyr, he loved one in ye house better than them bothe. And that? It is yourself. And then she defyd hym as she said to me.—WILLIAM KINGSTON."

Whether rightly or wrongly, Sir Francis was found guilty, and the last act of which we hear is that before his execution he draws out a bill of his debts. A facsimile of this bill is given in the "Annals of an Old Manor House," and it appears that a great proportion of these debts are what we euphemistically style debts of honour. To the "kynges majesty," for instance, he owes some 70*l.* One wonders whether the "kynge" exacted the payment of this debt from the bereaved father. The total of indebtedness would equal more than 12,000*l.* of our money. At the foot of the bill Sir Francis writes this message of farewell:—

"Father, mother and wyf, I shall humbly desyre you for the salvacyon of my soule to discharge thys byle, and for to forgive me of all the offences I have done to you. And in especyle to my wyf which I desyre for the love of God to forgive me and to pray for me for I beleve prayers will do me good. Goddys blessing have my children and meyne. By me a great offender to God.—FRANCIS WESTON."

On Wednesday, May 17, 1536, Sir Francis Weston was beheaded on Tower Hill, and Anne Boleyn on Tower Green two days later.

Mr. Harrison somewhat cynically epitomises him as "merely a butterfly crushed between the fierce millstones of ambitious intrigue."

There is mention of this tragedy to be found in the quaint old French verse of Chapelet's "Lettres d' Henri VIII.," of which a reprint was published in Paris in 1835.

The following is an attempt at translation into English of an early period:—

Poor Weston who was young of age,
Issue of anciant high lineage,
Well mannered and in grace surpassing.
In lists, dance, leaping, all oer-pacing.
In tennis play he did excel
All players in this land that dwel.
Not one dared plead in his behest
Save mother with grief opprest,
Who to the Kynge herself addresst;
His wyfe also offering full entirely
Rent and goods for his liberty.
But the Kynge still wold him execute,
No sentence framed by process wold commute.
And if for hym money had puissance,
Of crowns 'cent. mil' would need advance.

Sir Richard's life must have been grievously overshadowed this tragic event, and he did not survive his son many rs. He died on August 7, 1542, and was buried at Holy nity Church, Guildford. His tomb and those of his dendants who were interred in the same vault were destroyed he rebuilding of the church, which is now an ugly red-brick lding utterly deficient in architectural features.

From Sir Richard's will we find that he left plate valued at *l. 2s. 6d.*, equal to 2,000*l.* at the present time, sixty horses, head of cattle, 400 sheep, and the house well stocked h arms and armour, carpets and hangings. [These I uld say by way of parenthesis are not the present pieces of estry we have seen to-day, which belong to Mr. W. iney Harrison. The originals, if not decayed and worn out, y have been removed when the family ceased to reside at tton.]

We must remember he had fought for Mary, the wife of ilip, and it was probably a feeling of loyalty to her memory well as attachment to the faith of his fathers which restrained from active service on this momentous occasion. He s not seem to have forfeited the favour of the queen, or if had he soon regained it, for we find she paid a second visit st fire in 1560) three years later evidenced by the letter still served in the State records to Sir Henry Unton, the French abassador, which ends —"Given under our signet at Sutton, r Guilford, 11th November, 1591." Sir Henry died on ril 11, 1592, and was buried at Holy Trinity, Guildford, with grandfather. He was succeeded by his son, the second Sir hard, of whom I have only to say that he was born in 1564, rried on May 27, 1583, Jane, the daughter of John Dister, Bergholt, Essex, and died in 1613, having lived the quiet entful life of an English country gentleman of the period. ere is more to say of his successor, though he cultivated the s of peace rather than of war. This was a third Sir Richard, of the second, born in 1591. He spent much of his early in Flanders, where he could be educated in the Roman tholic faith without fear of interruption, and he devoted ch of his thought to the agriculture and the system waterways so superior in those countries at that time.

Aubrey says of him, "That worthy Knight, Sir Richard ston, conveyed the water from Stoke river, near Guildford, his Manour of Sutton, whereby he floated six score acres of und which aforetime was most of it dry. The same Sir hard brought the first clover grass about 1645 out of Brabant l Flanders, at which time he also brought over the conrance of locks, turnpikes, and tumbling bayes for rivers. He an the making of the New River."

Aubrey means the new channel of the Wey, not, of course, Hugh Myddelton's New River. This Sir Richard certainly ained high rank as a pioneer of English agriculture, and to e devoted himself with such absorption that he recked not the civil war raging between king and Parliament. In the y year (1645) that the battle of Naseby was fought he olished a remarkable book on agriculture, of which it is said he "Encyclopædia Britannica" article on the subject, that marks the dawn of the vast improvements since effected in gland."

Under the commonwealth he continued his favourite purs, and although he was looked upon as one of a Royalist ily, and though his estates were for a time sequestrated, he ceeded, by the help of a friend whose political opinions were he opposite colour, in getting the Long Parliament to pass n Act for rendering the Wey navigable from the Thames to ldford." The Bill was brought into the House of Commons December 20, 1650, and passed into law on June 20, 1651.

This good Sir Richard, the farmer, was married early in to Grace, the daughter of John Harper, of Cheshunt, and her he had fourteen sons and several daughters. In 1652 in his turn joined the great majority, and was laid to rest in family vault at Guildford.

There is little to say about his descendants, but it may be resting to trace the descent of the estate to its present ner.

Sir Richard was succeeded by his son John, who, in common his descendants, does not seem to have been knighted, and died in 1690 and was buried at Guildford. His only son, hard Weston, succeeded and died at Kingston in 1701. John ston, only son of the above, married Elizabeth, sister of mas Viscount Gage, by whom he had a daughter, who ceeded to the estate on his decease, June 4, 1730. She died narried—the last direct descendant of Sir Richard, the der of the family—on June 10, 1782, and devised the estate manor of Sutton to John Webb, of Sarnsfield, co. Here-l, on condition of assuming the name and arms of Weston. grandson, John Joseph Webbe-Weston, was an officer in Austrian Hussars, and his eldest daughter, Mary Anne ston, married Thomas Salvin, of Croxdale, in Durham. eir son, Mr. F. H. Salvin, is the present owner.

I cannot conclude without saying a word with regard to Frederic Harrison, who, in the preface of his annals, tells ow whilst pacing up and down the courtyard in the summer evenings the feeling grew upon him it were a pity should the old house pass away unchronicled, and thus he took up the labour of love, which has resulted in such a masterly record by pen and pencil of all the charms of the old mansion, that the book is as unique in its beauty as the old house itself.

I can only say that the pleasure I enjoyed in reading this book was far greater than the profitable knowledge (and that was great) which I gleaned from it.

The opening words of this preface are so apposite to the aims and objects of our Society, and to this occasion, that I will quote them :—

"One by one the old buildings of our country are perishing by accident, neglect or wanton destruction; their memory passes away and their place knows them no more."

Let us, then, endeavour to seek out such old houses and pen our little record of them.

In conclusion we may be thankful that Sutton Place has been spared till our time, and may we not utter the pious aspiration that it may long be spared to be the delight and admiration of future generations?

THE LATE MR. JOHN SMART, R.S.A.

A WIDE circle of artistic and other friends will hear with deep regret, says the *Scotsman*, the announcement of the death of Mr. John Smart, R.S.A., at the age of sixty-one, which took place on the 1st inst. at his house, Brunswick Street. It was in the end of last year that his friends noticed a great change in the appearance of this popular member of the Academy. Some malignant, internal disease had evidently laid its hand on him, and the once stalwart frame became bent and shrunken. Medical science could do little for him except to alleviate his sufferings. He gradually got worse, but in his weary hours art, which was the love of his life, has been his solace, and until he had to keep his bed entirely he has occupied himself by painting in water-colour and in doing a little etching.

Mr. Smart was born in Smith's Place, Leith Walk, on October 16, 1838, and had been identified with Edinburgh all his life. His father was an engraver and lithographer; his mother was a sister of the late Charles Morton, W.S., Crown agent. Educated at the Leith High School, he afterwards became an apprentice in his father's workshop; his art studies were commenced as a designer and engraver in the schools of the Board of Manufactures, and he studied painting in 1860 under the well-known landscapist of that day, Mr. Horatio MacCulloch, R.S.A. It was in that year that Mr. Smart first exhibited at the Royal Scottish Academy, his picture being entitled "Peeps through the Trees;" and from that day to this his name has never been out of the Academy catalogue. Having studied under such a master it was only natural that Mr. Smart should devote himself to landscape work. His tastes also all lay that way. To this department of art he accordingly applied himself diligently; his pictures, by their improving quality, soon began to attract the attention of critics and of the public, and in a few years he found himself one of the rising landscape artists of the day, with his works in great demand. In 1871 he was elected an Associate of the Academy; six years later he was appointed a full member, and by the public there were few names of Academicians better known than his. Mr. Smart had an intense love for his native country, and delighted to paint its beauties. Shortly after he embarked in earnest on his career as an artist he had a spell of painting in Wales, and in the exhibitions of 1863, 1864 and 1865 there were several landscapes of Welsh scenery from his brush. But for the most part it was Scotland's hills and dales that he depicted. He was not insensible to the gentle charm of Lowland scenery, but he made his name by painting the Highlands. The rugged grandeur of Highland scenery and the patriotic associations of the North strongly appealed to him. He loved the moor and the loch, the mountain and the quiet valley, and he painted them under their ever-changing weather aspects, and under the effects associated with morning, noon and eve, with great fidelity and power. Many of his pictures were wholly painted in the open air; all were directly studied from nature, and it may be feared that constant exposure in all weathers has told at last even on his robust frame. Like the master under whom he studied, Mr. Smart was no mere copyist of natural scenes. He freely used the artistic gifts of selection and arrangement. His pictures show a fine eye for pictorial effect; they are genuinely Scottish in aspect, and in each will be found some motive or sentiment to give them touch of human interest. His colour was fresh, natural and vivid in tone, and if he had not the dash and power of the brush which some of the younger men now cultivate, his execution was always agreeable and careful. Many will recall such pictures from his easel as "The Graves of Our Ain Folk" (1874), "The Gloom of Glen Ogle" (1880), "The Land of the Macgregor," "The Last Rest of the Clansmen" (1883), "Where Silence Reigns," for which he was

awarded a gold medal at the Edinburgh International Exhibition of 1886; and that charming composition which he had in the Academy last year, "A Dream of Strathearn," in connection with the painting of which he made between forty and fifty different studies. His diploma picture, which hangs in the National Gallery, was entitled "Far from the Busy World," and is like many other of his works a very pleasing epitome of Highland scenery. Perthshire, Inverness-shire and Argyleshire were his favourite sketching grounds. In recent years he painted a good deal at Lake Menteith and in Strathearn, many of the beauties of which he transferred to his canvas. A year ago he went to the Ayrshire coast, and almost for the first time painted the sea, and with much success. Works of this nature were exhibited this year in the Royal Scottish Academy's exhibition. Mr. Smart was one of the original members of the Royal Scottish Water-Colour Society, and as a water-colourist he produced numerous beautiful landscape drawings, which by many were as much admired as his oil-paintings. In water-colour he painted a few years ago most of the golfing greens of Scotland, and his drawings were afterwards etched. He exhibited regularly at the Glasgow Institute and at the Royal Academy, where his landscapes invariably had good places assigned to them. This year he adventured one of his Strathearn pictures all the way to France, and it cheered him in his illness to hear of the cordial reception it received at the Salon. As a matter of fact, Mr. Smart has not in the last decade shown better work than he has done within the past two years, and it is all the more to be regretted that he has been cut off while still painting at the top of his strength.

Mr. Smart was a good all-round man and citizen, with an individuality all his own, who took a great interest in many things besides art and the Royal Scottish Academy. He was a keen politician of Unionist sympathies, he kept himself in touch with municipal affairs, he was well read in Scottish history and in modern literature, he was a fervent admirer of Burns, most of whose poems he knew by heart; he was an ex-president of the Edinburgh Burns Club, he could turn a verse himself with great felicity; he loved music, could play the bagpipes, and sing a good song. Of that social and semi-literary fraternity called "The Monks of St. Giles" he was a member, and in their privately printed publications several of his songs and ballads appear. He was also a member of the Pen and Pencil and Scottish Arts Clubs, where his presence was always welcome. In the matter of outdoor recreation, Mr. Smart could play a fair game at golf, he enjoyed angling, and, as a member of "The Nest," he contributed an angling song and an illustration to a publication of the Edinburgh Angling Club. It might also be mentioned that in the early days of the Volunteer movement he was a gunner, and afterwards held a captain's commission in the Artists' Company of the Edinburgh City Artillery Corps.

One conspicuous feature in Mr. Smart's life was his untiring industry. He was a prolific worker, and whether in art or in social life what his hand found to do he did it with his might. There is no doubt he will be greatly missed by his old friends, and that his death is a distinct loss to the Academy, in the management of which he ever took the liveliest interest. He is survived by a widow, five sons and two daughters.

EXPLORATIONS IN CRETE.

THE special correspondent of the *Times*, writing from Canea on May 23, says:—It is proposed to establish a fund for the purpose of carrying out excavations in Crete under the joint direction of Mr. Arthur Evans and Mr. D. G. Hogarth, director of the British School at Athens. The undertaking has received the sanction of Prince George, who has consented to become patron of the fund. Several sites of typical historical importance have been reserved for British exploration, including Knossos, Praesos, Lyttos, the caves of Psychro (Dicte), Kamáras and Paxos, and the prehistoric fortresses of Kalamavka and Zakros, situated in the south-eastern corner of the island nearest to Egypt. It is intended to begin operations at Knossos and Praesos. The objects found will be placed in the Candia Museum, which, it is hoped, will be transferred to the ancient Venetian Armoury. A considerable sum will be required in order to prepare the building for their reception. The headquarters of the fund will be at Candia, where a house has been already secured. Important discoveries are anticipated throwing light upon the derivation of European culture from Egypt, the history of "Mycenæan" civilisation, and the early beginning of Greek art and social life. Within the last few days a large Mycenæan sepulchral chamber has been discovered by Mr. Evans at Mileto, near Candia, containing two earthenware chests adorned with decorative designs, and a score of fine painted vases, some of which present entirely novel types. The chests, which contained human bones, were extracted with some difficulty, and, together with the vases, have been placed in the Candia Museum.

EDINBURGH ARCHITECTURAL ASSOCIATI

MEMBERS of this Association visited Arbroath on S day on the occasion of their annual excursion. president, Mr. James Bruce, W.S., the past president, Thomas Ross, and the secretary, accompanied by about t members, proceeded by train to Elliot Junction, and walk Kelly Castle, now the country residence of Lord Pr M'Grady, who was unfortunately absent in London. The p increased by the presence of Mr. T. S. Robertson, arch the Procurator-Fiscal of Dundee, and others, was receive Mrs. M'Grady and her sons, and proceeded to examine castle, which is situated about two and a half miles Arbroath on the River Elliot. The oldest portions, built a 1442 by Sir William Ochterlony, have been much added to altered, and the building now is a picturesque and comfor house of red stone, having a fine walled-in garden with hedges 4½ feet thick. Luncheon was kindly provided by Provost M'Grady, and the President asked Mrs. M'Gra be good enough to convey to him the thanks of the Associ for permitting the visit and for his hospitality. Under leadership of Mr. T. S. Robertson the party then visited, b kind permission of Mr. Allan Fraser's trustees, Hospital the original of the Monkbarns of "The Antiquary." parish church and the abbey were next examined. The known abbey was founded in 1178, and the latest additions formed early in the fifteenth century. The Rev. W. I accompanied the members from the abbey to his church o Vigeans, built on the site of a Norman church, and rest twenty-seven years ago by Mr. R. Rowand Anderson, L Mrs. Duke kindly provided refreshments, and after Dr. I and the hostess had been thanked, the party returned to to

ESSEX ARCHÆOLOGICAL SOCIETY.

THE first excursion of the season in connection with Society took place on the 27th ult. The party me Witham station, and before the close of the day numb quite seventy. Among those present were Mr. G. Lowndes, president; the Rev. J. W. Kenworthy, the Rev. Curtis, Dr. Laver, Dr. Carr, Dr. McAndrew, Messrs. Chancellor, E. A. Fitch, I. C. Gould, W. J. Muckley, M Christy, E. Durrant, E. J. Harry, G. F. Beaumont, secretary, and others. The ladies were also well represen and there was a cycling contingent numbering about twe Although there was a keen wind a very enjoyable day spent. The first point of interest visited was Cressing Tem the site of one of the commanderies of the Knights Temp but of which only part of the moat remains. Some magnifi old barns, the date of which was assigned to the fifte century, stand on this site. Cressing Church was ente and Mr. Chancellor sketched its chief characteris Cressing, he observed, was said to have belonged Earl Harold, afterwards King Harold, together with With About 1150 King Stephen gave the manor, with the advow of the Church, to the Knights Templars. The church wa Norman origin. A move was next made to White No Church, details concerning this Norman structure being g by the Rev. A. F. Curtis, vicar. Mr. Curtis mentioned some people thought the chancel dated back to Saxon ti Mr. W. J. Muckley very kindly allowed the company to go White Notley Hall, and inspect his collection of flint im ments, Roman pottery, armour and other antiquarian obj The house was extremely interesting, and contained a l number of pictures, many of which were painted by Muckley himself, while two were by Constable. Mr. Muck in his paper, expressed the opinion that the place had occupied continuously from prehistoric times, judging by relics brought to light in excavating. Luncheon was partaken of, and in the village, near the inn, an cage was found, in a very good state of preserva Near by were some posts, supposed to have been as stocks. At Fairstead Church the company received by Dr. Manning, the vicar, who was former curate of Springfield, where he also had a school. Dr. Mani pointed out that a noticeable feature of the church was the large number of Roman bricks and tiles used in its construc and he ventured the opinion that on the site of the pre rectory a Roman villa once stood, and that the materials this were used in the building of the church. In his view tower was of Saxon origin, but Mr. Chancellor subsequ expressed the conviction that the tower, the nave, and pa the chancel were Norman. The south-east corner bea remarkable inscription—a "bidding prayer" for King Jam and in the tower of the church there is a pre-Reformation At Terling also the church was inspected. Near by, in a house, some fine panelling was seen, together with an overm of original oak. The last place visited was Faulkbourn, its church of Norman origin. This church stands in t grounds of Faulkbourn Hall, the residence of Mr. Christo W. Parker, who entertained the members to tea, and all

em to inspect several of the principal apartments and climb t the top of one of the towers, whence a splendid view is tained. Attention was drawn to the fact that the hall was irely built of brick, not a fragment of stone having been ed. Mr. Chancellor said he had made a careful examination the mansion, and could find nothing older than about 1580, hough a residence existed there before that date. He hoped t the Hall would remain for many generations in its present ner's family, and this sentiment was heartily re-echoed. veral new members were elected. Mr. and Mrs. Parker re heartily thanked for their hospitality, and thanks were o accorded to those who had read papers.

GLASGOW INSTITUTE OF ARCHITECTS.

A GENERAL meeting of this Institute was held on the 25th ult. in the rooms, Pitt Street, Mr. David Barclay, sident, in the chair. Attending—Messrs. A. M'Gibbon, m Thomson, Crawford, Watson, Paterson and Balfour; also ending—Mr. C. J. MacLean, writer, secretary. The Presi- nt gave a summary of the business transacted by the Council ing the past quarter, and the meeting was gratified to learn t the Corporation's committee on building regulations had eded to the suggestion of the Institute, that a conference uld be held between that committee and the representatives he Institute while the clauses of the proposed new Bill were ng considered and before they had been passed by the rporation. A committee of the Institute had had a meeting h the Corporation committee, who considered it desirable t they should be favoured with the views of the Institute n the existing building regulations and any alterations, endments or conditions which the Institute might suggest, ecially as to the question of the height of buildings. As to new matters which the Corporation might propose to deal h in the Bill their committee had promised to show these in ft to the Institute. The secretary reported that the Royal titute had decided to support the principle of Lord Russell's on Secret Commissions, now before Parliament, and had ured him of their hearty co-operation and their sympathy h the objects of the Bill, and that the action they had taken this matter generally was very similar to that which had n taken by the Council of the Glasgow Institute. It was reported that the Royal Institute had agreed to their ual dinner in 1901 being held in Glasgow early in October hat year before the close of the exhibition, and it was olved that a local committee be formed to make suitable ngements for the occasion. The Institute agreed to take rge of the examinations for this district of the Royal titute, which will be held in Glasgow during June, provided fficient number of candidates come forward for examination.

TESSERÆ.

Botticelli's "Assumption."

THE history of this painting, which was purchased for the National Gallery in 1882, is remarkable. It was executed, aps about 1472, for Matteo Palmieri, and placed in the ily chapel in S. Pietro Maggiore, Florence. Palmieri was an of distinction and learning, who rendered important omatic and other services to the Republic. A profound logian and an earnest student of Dante's works, he com- d a poem somewhat on the model of the "Divina Com- dia," in which he supposes himself conducted by the næan Sibyl through the Elysian fields to Heaven, the "City ife." After his death and honourable burial in or after 5, this poem, which had not been circulated previously, me suspected by invidious critics of containing some rthodox views as to the nature of angels. This was brought e notice of the Church authorities, and, pending inquisition, picture, which was supposed to reflect in some way the nised doctrine in the poem, was covered, and the chapel in ch it stood closed to public worship. Finally, after some e of time, the book was declared innocuous and the chapel reopened. Meanwhile, however, the question of Palmieri's sy had been so violently debated in Florence that the y spread through Europe, giving rise by degrees to curate and extravagant reports which were variously re- ted by ecclesiastical writers, some of whom stated that mieri had been burnt alive for heresy, others that his body been disinterred and burnt, together with his poem. ari, in his "Life of Botticelli," accurately describes the picture, ing that the painter, no less than Palmieri, was included by malevolent in the charge of heresy. The painting bears lence of intentional injury, the faces of the donor and his having been scored through: an attempt to restore them subsequently made. At some uncertain period it was oved to the Villa Palmieri, the country seat of the family, near Florence. On the death of the last heir, within this century, the picture fell into the hands of a Florentine dealer, and still later became the property of the eleventh Duke of Hamilton.

Francis Bird.

In the reign of Queen Anne and for some years afterwards, sculpture was in a manner monopolised by Francis Bird. The public works by his hand, which inspire nobody with a curiosity about the artist, are not good testimonials in his favour. He was born in Piccadilly in 1667, and sent at eleven years of age to Brussels, where he learnt the rudiments of his art from one Cozins, who had been in England. From Flanders he went to Rome, and studied under Le Gros. At nineteen, scarcely remembering his own language, he came home, and worked first for Gibbons, then for Cibber. He took another short journey to Italy, probably on foot, and at his return set up for himself. The performance that raised his reputation was the monument of Dr. Busby, the famous master of Westminster School. The latter had never permitted his picture to be drawn. The moment he was dead his friends had a cast in plaster taken from his face, and thence a drawing in crayons, from which White engraved his print and Bird carved his image. His other principal works were:—The Conversion of St. Paul, in the pediment of that cathedral. Any statuary was good enough for an ornament at that height, and a great statuary had been too good. The bas-reliefs under the portico. The statue of Queen Anne, and the four figures round the pedestal, which formerly stood before the same church, and of which the existing figure is a copy. The author of the Abregé, speaking of English artists, says:—"With regard to sculpture, the marble groans, so to speak, under the chisels of those who have executed the group of Queen Anne placed in front of St. Paul's, and the tombs of the Abbey of Westminster." This author had not seen the works of Rysbrach and Roubiliac; and for the satire on the group of Queen Anne we may pardon the sculptor who occasioned it, as it gave rise to another satire, those admirable lines of Dr. Garth. The statue of Cardinal Wolsey, at Christ Church. The brazen figure of Henry VI., at Eton College—a wretched performance. A magnificent monument in Fulham Church, for Viscount Mordaunt. Bird received 250*l.* for his part of the sculpture. The sumptuous monument of the Duke of Newcastle in Westminster Abbey, erected by the Countess of Oxford, his daughter. The recumbent figure is not the worst of Bird's works. The sculptor died in 1731.

Margate.

Mr. Ruskin, like other people, is hard upon Margate:—"If we enumerate the English ports one by one, from Berwick to Whitehaven round the island, there will hardly be found another so utterly devoid of all picturesque or romantic interest as Margate," and he is much surprised that Turner was so fond of painting it; "he repeated Ramsgate, Deal, Dover and Margate I know not how often." ("Harbours of England," p. 39.) To a simple mind the accessibility is reason enough; and when "Turnerian topography" is allowed for, and the fact that sea and sky are very commonly the chief features in our painter's work, there seems nothing to be surprised at. In fact, this Margate (in the "Harbours of England") is a study of rough waves and stormy clouds, helped out by a gleam of chalk cliff. But the real Margate is not so "devoid," as Mr. Ruskin declares, and there is more to be seen there than terraces and bathing-boxes—which last, by-the-by, have an historical connection with the town, for in Margate, about the year 1790, bathing-boxes made their first appearance on any shore. A "gate" is, properly, not an obstacle in a passage, but the passage itself, the going-place. "Gait," manner of going, is a modification of the same word; the Scotch word (variously spelt) means way, road—"I gaed a waefu' gate yestreen;" "Gang your ain gate." The "ghauts" which allow you to come down to the edge of a Hindoo river are doubtless the same things, in fact and in etymology, as the "gates" in the Kentish chalk cliff, and such places must always have been notable points in topography. Mergate (the old form) one would say at first sight must certainly mean "Sea-gate;" but a small river or brook is sometimes called "Mere," and there used to be one running to the sea, perhaps in a network of little channels, through the shallow valley which is still called The Brooks, near the South-Eastern Railway station. This rivulet has disappeared, sucked up probably by the town water-works. But Mergate, or Margate, was formerly but the name of the harbour or roadstead; the village was St. John, so marked on the map of Kent in Holland's Camden ("Britannia," 2nd edition, 1637); a village with one foot on sea and one on land, possessing a fine large church, even then of a venerable antiquity, the sepulchral brasses inlaying its floor already worn by the feet of many successive generations of mortals. It was when George III. was a handsome young king that the English people began to suspect sea air and sea bathing to be salubrious, and that it might not be a bad thing for Londoners to repair to the coast in summer-time. The fashion rose and flowed like

the tide itself, and has never since receded. Margate Bay, with its fine sands, so accessible from London, was the favourite resort, and sprang into fame and importance. Cecil Square, with the large Assembly Rooms resting on pillars, and several trim streets round it, were then built, and still retain a pleasant last-century flavour. The name Margate gradually superseded "St. John," but had not done so entirely in the year 1800.

Foreshortening in Reliefs.

Amateur judges often pronounce erroneously on the merits of "alti" or "bassi-rilievi" from not being acquainted with a very essential principle which should prevail in works of the kind. There should be no foreshortening of the limbs in relief, and there should be no attempt, by diminishing the size of objects, to give the effect of distance. Exceptions may be found, but the ancients, who are the best masters in all that relates to the practical in sculpture, seem to have made this a general rule. Sculpture professes to represent "form," and can only represent by form. Foreshortening form must make it monstrous. To represent an arm extended, with the fingers pointed directly in front of the spectator, in "basso-rilievo," the tips of the fingers must be made to spring from the shoulder; for, for want of space, the intervening portions of the limb, viz. the hand, wrist and arm, could not be represented. The ancient sculptors seem to have acted so entirely on the principle here laid down that they scarcely ever attempted to represent a front face in "basso-rilievo." The same principle precludes the representation of distance or of remote objects. It is not possible to give the effect of distance or space when the colour remains the same on all objects, and is equally bright in all parts of the work. Sculpture is to give form in "fact." Painting has only to give it in "appearance." The attempts to overcome these difficulties by the sculptors of the seventeenth and eighteenth centuries, though ingenious, could not be referred to as good specimens of sculpture. They are many of them admirable for qualities of design; but they are fully as much, or more, painters' than sculptors' compositions.

Interest of Archæology.

Archæology has been defined as the key which unlocks to our use the buried treasures of the past ages, and compared to the telescope as the medium through which far distant things are revealed to our knowledge. Archæology, if properly worked out, is a plain history of the human mind and its resources from the creation of the world to the present time, and as a popular science should go hand-in-hand with geology. Geology reveals the progress of natural causes; archæology discovers the history of whatever is produced by art—archæology exhibits in a wonderful manner the influence which an acquaintance, or the contrary, with the use of and value of metals, and even personal ornaments, have had in promoting or retarding the progress of civilisation throughout the universe. The origin of every wonderful science must be defined and its elements traced out by the archæologist. The archæologist must comprehend why many grand and obvious principles in the laws of nature have not been long since understood and turned to practical account. It is the observation of Madame de Staël that "the erudition derived from archæology is far more animated than that we acquire from books." In this view has Madame de Staël popularly shown how archæology affects history. Without its aid history is but fable, or what is worse than fable—theory. History may record the rise and progress of nations, but archæology establishes or contradicts their existence, and must be the evidence whether history be true or false. Archæology cannot take its proper position as a science until its value is acknowledged, its treasures arranged and its principles understood. In the process of procuring the most precious ore, much worthless matter has often to be carefully sifted and cast away before its sterling worth can be ascertained. So must the rubbish which encumbers the golden treasures of archæology be gradually cleared away by scientific labourers. In this, however, the great difficulty is to say what is, or what is not, deserving the name of rubbish. A single character or mark upon the merest fragment of a stone, or on a piece of clay, may be of infinite importance in forming a link wanting decidedly to connect a chain of convincing argument—that link in historical evidence can only be supplied by the study of archæology.

Correspondence

Treatment of Proposed Interior Decoration of St. Paul's Cathedral.

Sir,—The interior decorative treatment of St. Paul's Cathedral engages at present seriously public attention. The Press lately published numerous opinions by art lovers on the subject. I now humbly venture to add a few words in ho that the sister arts, architecture, sculpture and painting, correctly be employed to complete Wren's masterpiece. the mind of an artistic observer the following facts m present themselves, viz.:—(1) The interior of the present do (or funnel) in its dismal and gloomy darkness must prev during ten months of the year any decorations to be prop seen, and therefore it follows that the worshipper is t disabled by a natural depression of spirit to elevate his m to the light of a heavenly and glorious inspiration. (2) remove this serious obstacle I propose the follow remedy, viz. a flat spherical dome (tazza), receiving su cient reflective light through the present side windo immediately under the present dark dome, should be s stituted, forming a light and solid sheet-metal elliptic s or flat dome (thanks to modern constructive science), base being the present chief cornice below the old dark do this construction has no lateral pressure on side walls, and its strength, lightness and easy construction involves no g expense, while the artistic and aerial treatment of its wh surface effectually removes the disturbing incubus now oppressive to the beholder. I sincerely trust and wish that impartial enlightened authority, free from prejudice and influence of personal private interest, will arrive at the de mination of doing right, and thus secure to themselves thanks of the present and future generations.—I am, sir, y obedient servant, Frederick San

Flanged Bent Safes.

Sir,—As the matter is at present the subject of legal p ceedings (to which neither Mr. Charles Lee nor his firm ar party) we are debarred from entering into any detail.

One would suppose from Mr. Lee's letter that there some sort of similarity between the safes which he descri and those in question. There is not. The safes to which refers, made by Messrs. Hobbs, Hart & Co., have all corners at the top and at the bottom jointed; the construct being similar to that of a coffee canister—that is to say, vertical corners are bent and the top and bottom are jointed the shell thus formed—instead of being bent solid according our method.

If Mr. Charles Lee has desired by his letter to give t public the impression that the safes of his firm are similar those made under our patent, that is to say, with all corners bent solid instead of jointed—we must leave it to h to consider whether he is not giving an example of t "wriggling and resort to subterfuge" which he affects to plore.—We are, dear sir, yours faithfully,

Samuel Chatwood, M.I.Mech.E.,
Bolton: June 6, 1899. Bankers Engineer

GENERAL.

The Médée of Eugène Delacroix was sold last week in Pa for 40,500 francs. For a portrait of Columbus, attributed Sebastian del Piombo, 30,000 francs were paid.

Mr. C. E. Dance has been appointed surveyor to t Metropolitan Asylums Board at a salary of 500*l.* per annu with travelling expenses, office accommodation, and su assistance as the managers from time to time will de necessary.

A Portrait of the late William Huggins, the Liverp painter, by himself, has been presented to the Walker Gallery by Mr. John King.

Mr. W. L. Henderson, architect, of Aberdeen, died a days ago in his seventieth year. His firm, Henderson & S designed many Free churches, schools and parsonages.

The Subscriptions promised towards the contempla cathedral in Belfast do not amount to more than 17,000*l.* not one-tenth of the amount required.

The New Offices for the Tees Conservancy in Midd brough have been commenced. Messrs. Bottomley & W ham are the architects.

The Site of Christ Church, Birmingham, will soon be re for the builders of the new offices to commence operations.

The University of Chicago has set aside 5,000 dols t defray the expenses of explorations which are about to be u ducted under its auspices in Yucatan. A collection of hithe unknown ruins has been discovered lately some distance so east of the city of Merida, on the north coast, and a represen tive of the University paid a visit to the spot this winter. found the remains of what seemed to be an enormous tp dwelling, with buildings scattered around it over an are nearly a mile. The main edifice was built massively of st and the façades were literally covered with the most intri and beautiful carving.

Architect and Contract Reporter

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to rise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. *on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-Rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s.. by post 2s. 6d., on early application to the Publisher, Imperial Buildings, Ludgate Circus, London, E.C.

For Advertisement Scale, see page xiii.

COMPETITIONS OPEN.

HARROGATE.—July 3.—Premiums of 150*l.*, 100*l.* and 75*l.* offered for designs for erection of a new Kursaal, &c., in connection with the Spa Concert Room. Cost not to exceed 40,000*l.* Premiums of 100*l.*, 75*l.* and 50*l.* Mr. Edwin Hughes, vestry clerk, Vestry Hall, Plumstead.

WAKEFIELD.—June 30.—The Wakefield Industrial Society, Limited, offers three prizes for the best architectural designs for new central buildings most suitable to meet their requirements. Prizes: (1) 50*l.*, (2) 30*l.*, (3) 20*l.* Full particulars at the Office, Bank Street, Wakefield.

CONTRACTS OPEN.

ABERTILLERY.—June 12.—For rebuilding of two shops and business premises in Commercial Road. Messrs. Swash & Bain, architects, Midland Bank Chambers, Newport.

AMESBURY.—June 15.—For alterations and additions to the sick wards and laundry at the workhouse. Messrs. John Harding & Son, architects, High Street, Salisbury.

ASHBURTON.—June 15.—For erection of offices for the Ashburton School Board. Mr. H. M. Firth, clerk, Ashburton.

BASINGSTOKE.—June 21.—For erection of a joint isolation hospital. Mr. James Gibson, 3 New Street, Basingstoke.

BECKENHAM.—June 19.—For erection of a technical institute and public swimming-baths, including a covered bath 100 feet by 30 feet, an open-air bath 80 feet by 25 feet, 15 slipper baths, together with administrative laundry, boiler-house, &c., in Beckenham Road. Mr. F. Stevens, clerk to the District Council.

BRADFORD.—For erection of four houses at Ounsworth Street, Wakefield Road. Messrs. James Young & Co., architects, 62 Market Street.

BRADFORD.—June 15.—For erection of a store in Otley Road and Dover Street. Messrs. Rycroft & Firth, architects, Bank Buildings, Manchester Road, Bradford.

BRIDGWATER.—June 13.—For repairs and alteration of the town pound at the corner of Angel Crescent and Market Street. Mr. W. T. Baker, town clerk, King Square, Bridgwater.

BRIDLINGTON QUAY.—June 21.—For erection of dwelling-houses and a detached villa residence on the north side of Lansdowne Road and west side of Lansdowne Crescent. Mr. Samuel Dyer, architect, Bridlington Quay.

BRIGHTON.—June 30.—For construction of an underground convenience, with works connected therewith, around the base of the clock tower, Queen's Road, Brighton. Mr. Francis J. C. May, Town Hall, Brighton.

BRIGHTON.—July 27.—For alterations and additions to the public library, museum and art gallery on the Pavilion estate. Mr. Francis J. C. May, Town Hall, Brighton.

BROTHERTOFT.—June 12.—For enlargement of the Barley Sheaf school, at the Barley Sheaf, in the parish of Brothertoft. Mr. Jno. H. Tooley, 6 Bridge Street, Boston.

CANTERBURY.—June 16.—For alterations, additions, repairs, plastering and sanitary work to wards C2 male and female, and alterations to matron's quarters, at the Kent County Lunatic Asylum, Chartham Downs. Mr. W. J. Jennings, architect, 4 St. Margaret's Street, Canterbury.

CASTLETON.—June 12.—For erection of shops, stables and dwelling-house. Mr. Wm. Young, architect, Park Road, West Hartlepool.

CHESTER-LE-STREET.—June 12.—For erection of eight cottages at Daisy Hill. Mr. Black, Daisy Hill Branch Stores, Chester-le-Street.

CORNWALL.—June 19.—For erection of a fog-signal house, dwellings, &c., at Penlee Point, near Cawsand, Cornwall, for the Corporation of Trinity House, London, E.C. Mr. E. G. Verity, 31 Golden Square, London, W.

CORNWALL.—June 19.—For erection of six coastguard houses and an officer's house at Mullion. Mr. Alfred H. Jenkin, solicitor, 1 Alma Place, Redruth.

STURTEVANT
FAN SYSTEM
OF WARMING AND VENTILATING.
(PLENUM METHOD.)
STURTEVANT ENGINEERING CO. 75 QUEEN VICTORIA ST. LONDON
GLASGOW, BERLIN, STOCKHOLM, MILAN, AMSTERDAM.

CREWE.—June 14.—For erection of a chimney stack and buildings, including iron roof work and water-tank for the electricity works, Edleston Road. Messrs. Hopkinson & Talbot, architects, 29 Princess Street, Manchester.

CROYDON.—For erection of a private residence at South Croydon. Mr. W. Towell, architect, 21 Buckingham Street, Strand, W.C.

CROYDON.—June 13.—For erection of schools, with a central hall, for 1,220 children, in Ecclesbourne Road, Thornton Heath. Mr. H. Carter Pegg, architect, 6 Sudbury Road, Thornton Heath.

CROYDON.—June 20.—For repairs and painting at the public slaughter-houses, Pitlake. Mr. E. Mawdesley, town clerk, Town Hall, Croydon.

DURHAM.—June 10.—For alterations to premises, 25 Market Place. Mr. H. T. Gradon, architect, 22 Market Place, Durham.

DURHAM.—June 14.—For erection of a laundry at Blackhill. Mr. Geo. Thos. Wilson, architect, 121 Durham Road, Blackhill.

EDINBURGH.—June 26.—For extension of boiler-house, central station. Mr. Thomas Hunter, W.S., town clerk, City Chambers, Edinburgh.

FALMOUTH.—June 12.—For alterations to the Summerhill Hotel, Chapel Terrace. Mr. R. Billett, proprietor.

FAYGATE.—June 15.—For additions and alterations to the Beeches, Faygate, Sussex. Mr. William Buck, architect, Horsham.

FLEETWOOD.—June 16.—For erection of a museum at Rossall School. Messrs. Austin & Paley, architects, Castle Hill, Lancaster.

GLASGOW.—June 22.—For alterations to Polmadie old police buildings. Mr. John Lindsay, interim clerk, City Chambers, Glasgow.

GLOUCESTER.—June 12.—For erection of a cattle-shed and other works at the Field House Farm, Awre, and piggeries and boiling-house and other works at the New House Farm. Mr. Thomas Cadle, Lynwood, Denmark Road, Gloucester.

GRAYS.—June 12.—For erection of four pairs of semi-detached houses and other buildings at Grays, Essex. Mr. C. M. Shiner, architect, 3 Bond Court, Walbrook, London.

GUISBOROUGH.—June 14.—For erection of additional school accommodation at Skelton Green. Mr. W. Richardson, clerk to the School Board, Guisborough.

HALESWORTH.—June 13.—For erection of a new entra porch and cloakroom at the Wisset Board school. Mr. Art Pells, architect, Beccles.

HALIFAX.—June 20.—For erection of eleven houses Ovenden Wood. Messrs. Jackson & Fox, architects, 7 Raw Street, Halifax.

LONDON

WOLSINGHAM.—June 12.—For erection of two cottages with outbuildings, at Tunstall reservoir. Mr. Askwith, South Road, Bishop Auckland.

WORTHING.—For erection of a Wesleyan church and schools. Mr. John Wills, architect, Victoria Chambers, Derby.

THE NEW PALACE STEAMERS.

THIS well-known line of steamers has commenced its runnings for the summer. The *Royal Sovereign* plies between London and Ramsgate, calling (after June 20) at Southend, and leaves Old Swan Pier at 9.20 A.M., and Ramsgate for the return journey at 3.15 P.M. every day, including Sunday, but excluding Friday. The *Koh-i-Noor* will (after June 17) run between London and Margate daily, calling at Southend, and leaving, on the return voyage, Margate at 3.15 P.M. and Southend at 5 P.M.

La Marguerite will run (on and after June 28) to Southend, Margate, Boulogne and Ostend, and *La Belgique* (on and after July 1) to Southend, Margate and Ostend. These boats also sail from Old Swan Pier. It is open to intending travellers to go by boat and rail from Fenchurch Street or St. Pancras. One good feature has been introduced this season—the catering is entirely in the company's hands. With a continuance of the present favourable weather these deservedly popular boats should be largely patronised, and especially so as for parties of fifteen and over specially reduced fares are charged.

THE Swindon and District Hospital Board have accepted in an open competition the plans of Mr. G. Halliday and Mr. T. W. Rodger, architects, of Cardiff, for the erection of an extensive hospital at Swindon, and the joint architects have been instructed to prepare the necessary drawings to carry out the work. The same architects have been among the first three in each competition for similar works in which they have entered, and in the case of the Southampton Hospital, where there were forty-three competitors, they received the second premium. In the Swindon competition there were some twenty competitors.

D. Jones	1,300 0 0

ELECTRIC NOTES.

THE electricity committee of the Manchester Corporation have accepted the tender of the Westinghouse Electric Company, Limited, for the supply and erection at the Bloom Street generating station of four 1,800 K.W. combined engine and dynamo machines.

THE Portsmouth Corporation electric-lighting balance sheet shows a net profit on the year's working, after making allowances for the sinking fund, &c, of 2,500*l.* Of this sum it is proposed to hand over a cheque for 1,000*l.* towards the relief of local rates, treating the balance as a reserve fund. This is the fifth year the works have been open, and the result is considered satisfactory. The Corporation is now making arrangements to take over the tramways and run them by electric traction.

IT is stated that an offer has been made to the Southend Town Council by a London capitalist to construct a huge sluice sea-wall at a cost of 600,000*l.*, in return for which he asked permission to construct an extensive generating plant and use the tidal force for its working, with the idea of supplying the metropolis with electric motive power. He guarantees that there shall be never less than 3 feet 6 inches of water on the beach, which is dry for a long distance now at low water; in fact, it will be a huge marine lake. The proposal is under consideration.

THE Local Government Board, having given consent for Grimsby Town Council to borrow 43,500*l.* to carry out an electric lighting scheme in the borough, the Corporation public lighting committee have decided to recommend the acceptance of the tender of Messrs. Hewins & Goodhind, of Grimsby, for the erection of buildings and chimney shaft at a cost of 11,525*l.* 2*s.* There were five tenders altogether, one from Stalybridge, another from Leicester, and three local ones, Messrs. Hewins & Goodhind being the lowest.

AT the annual general meeting of the Institution of Electrical Engineers the award was announced of the premiums for papers read during the past session, as follows:—The "Institution Premium" to Mr. P. V. McMahon, the "Paris Electrical Exhibition Premium" to Messrs. Duddell and Marchant, the "Fahie Premiums" to Professor Oliver Lodge and Mr. G. Marconi, and extra premiums to Mrs. Bertha Ayrton and Mr. J. Elton Young. Students' premiums for papers read before the students' section were awarded to W. G. Royal-Dawson, M. R. Gardner, E. P. Howgrave-Graham, Leonard Wilson, I. R. Morshead and Mr. H. M. Dowsett. The "Salomons Scholarship" was awarded to Mr. H. J. Thomson, a student of the Central Institution. The premiums and scholarship cheque will be presented at the first meeting of the next session in November. Professor Silvanus P. Thompson, D.Sc., F.R.S., has been elected president for the ensuing year.

TRADE NOTES.

A LARGE new Cambridge chime clock has just been erected in the parish church tower at Watermoor, Cirencester, which has all the latest improvements, and is guaranteed by the makers, Messrs. John Smith & Sons, Derby, to keep time within fifteen seconds a month.

MESSRS. EDGAR KEELING, TEALE & CO, LIMITED, 102 Mount Street, Berkeley Square, W., have been entrusted with the execution of all the wrought-iron electric and gas fittings—the wrought-iron balusters and railing for main staircase, and the wrought-iron entrance gates at St. Olave's Union new offices, Tooley Street, S.E.

THE Omagh Asylum, now in course of erection, is being ventilated by means of "Cousland's Improved Climax" patent direct-acting invisible roof ventilators, supplied by the sole manufacturers—the "Climax" Ventilating and Heating Co., Limited, 93 Hope Street, Glasgow.

THE Cefnywaen new school, near Carnarvon, is being warmed and ventilated by means of Shorland's patent Manchester stoves, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

BUILDING AND BUILDERS.

THE foundation-stones of the new Providence Church at Churchbridge, Oldbury, were laid on the 5th inst. The new church, which will accommodate about 400 persons, is to be built at a total cost of 1,300*l.* Messrs. Wood & Kendrick are the architects, and Mr. J. Dallow the builder.

AT the monthly meeting of the Middlesbrough School Board it was decided that the plan of Mr. J. M. Bottomley, of Middlesbrough and Leeds, for the new Board schools at Ayresome, be accepted. The estimated cost of the new schools is 12,000*l.*

THE foundation-stones of a new Congregational chapel and Sunday school for Pickup Bank and Hoddlesden, near Darwen, were laid on the 3rd inst. The school and chapel are estimated to cost about 3,500*l.*

IT is proposed to erect a new Protestant hall for Liverpool, to be called the Latimer and Ridley Hall. This is to occupy a central position in the city, and to be erected at a cost of about 3,000*l.*

AT Deeplish, Rochdale, memorial-stones of a new Baptist school-chapel have been laid. The proposed building, which is expected to accommodate about 400 persons, is being erected to receive the congregation which for some time has worshipped in the mission-room in Fishwick Street. The cost of the school, exclusive of furnishing, will be about 1,400*l.*

A CONSULTING engineer and his son, in Birmingham, have this week secured, says the *Daily Telegraph*, British and international protection, under the Patent Acts, for an invention entitled "A Mechanical Bricklayer," for use in automatically laying, cementing and levelling bricks, slabs, stones and the like in the construction of fortifications, piers, bridges, viaducts, warehouses, dwelling-houses and buildings of every description. The "mechanical stoker" has proved a success, and the inventors consider the time ripe for the introduction of "a mechanical bricklayer." Should this development succeed the day may come when houses and factories will be built on the "penny-in-the-slot" principle. The thrifty landlord will put a copper in the hole and the automatic workman will duly lay a brick.

GEORGE HAIG, of Springfield Avenue, King's Heath, a carpenter in the employ of Messrs. Lidzey & Evans, builders, Birmingham, fell from a scaffold on which he was at work in the Station Road, King's Heath, on the 1st inst., and was killed. He overbalanced himself whilst reaching for a tool, and fell a distance of 35 feet, alighting on his head, which was terribly injured. The deceased was a single man, and had only recently arrived from Cardiff.

THE foundation-stone of the new English church at Weimar was laid on the 1st inst. by the Grand Duke. Among those who took part in the ceremony were the representatives of the English colony, the Chief Burgomaster, and the American Consul.

PLANS have been prepared for a cottage hospital for Blairgowrie and Rattray districts, extending from Glenshee and Strathardle in the north to Coupar-Angus on the south, and from Alyth on the east to Clunie and Delvine on the west, and building operations are expected to be begun in about a month. The site, kindly presented by Mrs. Macpherson, of Blairgowrie, extends to fully an acre, and is situated in a triangular-shaped piece of ground enclosed by Perth Road, Ann Street and Ewan Street. The hospital will be built on the most recently approved principles, and no pains have been spared in trying to evolve an institution embodying accommodation, utility and efficiency, combined with economical structure. The estimated cost of the building is 1,600*l.*, but at least 5,000*l.* is necessary for furnishing and partially endowing the institution.

THE memorial-stone of the mission halls in Ruchill Street, Maryhill, Glasgow, was laid on the 27th ult. The premises form a portion of a scheme of church building undertaken by Westbourne Free Church. For many years the congregation have undertaken mission work in the district, the rapid development of which has determined them to place a church there. It is intended that comparatively soon a church to accommodate about 800 persons shall be erected on the same site, and that the mission premises shall be handed over to the new church. The halls will occupy a frontage to Ruchill Street of 42 feet, and provide on the ground floor a hall measuring 47 feet by 40 feet, with a lesser hall 16·6 feet by 22 feet, and a small room 8 feet by 13·6 feet. On the upper floor there will be a hall 16·6 feet by 45 feet, divided with a folding partition, a library and a sewing-room. At the back of the premises a house of three rooms and kitchen will be provided for the beadle. The elevation to Ruchill Street is of an ecclesiastical character, which will harmonise with the future church. The halls, which are principally lighted from the roof, will be fitted up in the most approved way. The architects are Messrs. John Honeyman & Keppie.

PRICES AND PARTICULARS ON APPLICATION TO

THE UNITED ASBESTOS CO., LTD., 158-160 CHARING CROSS ROAD, W.

Chief Offices—Dock House Billiter Street, E.C. Also at Manchester, Newcastle, Liverpool, Hull, Cardiff, Glasgow, Bristol, &c., &c.

THE foundation-stone of a new Catholic blind asylum, in extension of the schools for the blind in Brunswick Road, Liverpool, was laid on Sunday last. These schools had been altered and extended several times to meet increasing demands for accommodation, but still the requirements are unsatisfied. Some time ago the governing committee decided to erect a new home in the country to which the children could be drafted, and after anxious consideration it was decided to erect the new asylum in West Derby. A site was chosen adjacent to Rice House, in Yewtree Lane, and here the new building will be erected. The building will be of brick, in the Gothic style of architecture, of two storeys. The front will be at the north-west corner of Yewtree Lane, and the main entrance in the centre of the building. There will be a large entrance-hall, extensive corridors right and left of the entrance giving access to the schoolrooms, dayrooms, parlours, sisters' rooms, &c., and a kitchen, dining-room and laundry will also be provided. The building will accommodate twenty-six children, with room besides for an infirmary of six beds, while a small temporary chapel will be arranged. The total cost, including furniture, is estimated at 4,000*l*., which money has been borrowed from the Liverpool School Board. The architects are Messrs. Sinnott, Sinnott & Powell, and the contractor Mr. M. Fogarty.

VARIETIES.

THE Prince of Wales will lay the foundation-stone of the new buildings of the Royal School of Art Needlework at the corner of the Imperial Institute Road, South Kensington, on the 23rd inst.

THE new reformatory at Loanhead was opened on the 3rd inst. The building, which is a commodious structure, will accommodate about fifty girls, the old place at Dalry having proved too small for the requirements. The buildings have cost about 6,250*l*.

AN elaborate oak reredos, consisting of shafts, pinnacles and arcading, has just been dedicated in St. Andrew's Church, Eccles, near Manchester. The whole forms a frame to a sculptured panel in high relief; subject, The Lord's Supper. The reredos was designed by Mr. Frank P. Oakley.

THE new fire brigade station which has been erected in King Street was formally opened by the Corporation on the 31st ult. The building is of three storeys, and all the necessary equipments are provided for a permanent staff. The cost of the buildings is about 12,000*l*.

THE new schools which have been erected in connection with St. Mary's Church, Aston Brook, Birmingham, were opened on Saturday afternoon. They will accommodate about 400 children and have cost about 3,000*l*.

THE enlargement of the nave and the widening and renovation of the chancel of Christ Church, Barnton, Northwich, have been commenced. A stained-glass window is being inserted in the chancel in memory of the late vicar (the Rev. S. L. Laidman).

ON the occasion of the Prince of Wales's visit to Hammersmith to lay the foundation-stone of the new Savings Bank buildings of the General Post Office on the 24th inst., his Royal Highness will drive in semi-state, and with an escort, from Marlborough House to Hammersmith Road. The Post Office Volunteers will form a guard of honour inside the large marquee which is to be erected, and will also furnish the band. Places in the large marquee will be reserved for important officials.

WE understand that Mr. Wm. J. Moore, the head of the street lighting department of the Welsbach Incandescent Gas Light Company, Limited, is leaving that company, and is about to take up similar duties in the New Sunlight Company, where he is to be entrusted with the organising of a very complete department.

IT is announced that at the Paris Ecole des Beaux-Arts it is intended to open, but not till next year, three special ateliers for women—for painting, sculpture and architecture respectively. Up to the present time only one lady pupil has entered her name as an intending student in architecture, but it is expected that the opening of the new atelier will soon attract others.

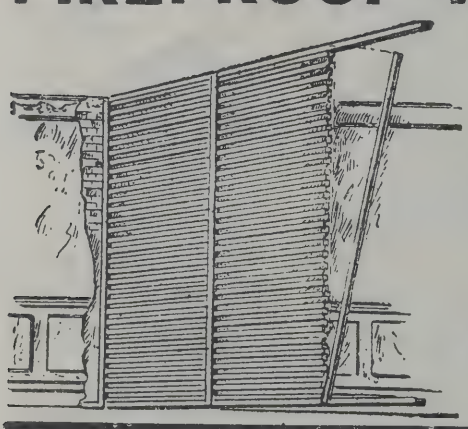
AT Droitwich, on the 3rd inst., a new station on the Great Western Railway system was opened. The erection of the station has been rendered necessary by the increasing number of visitors to the brine baths. The Great Western Railway Company were stimulated to take up the work by a gift of land from Mr. John Corbett, a magistrate resident in the town. They purchased another parcel of ground, and erected a new station costing nearly 7,000*l.* and furnished with up-to-date sanitary and other appliances. The platforms, 500 feet long, are on a level with the floor of the carriages. There are sheltering verandahs, with glass let into the roof, both within and without the station. The waiting-rooms are cheerful, the platforms well-lighted, and the whole station presents a bright and cheerful appearance.



THE new bridge over the river Southesk at Kirkton of Clova was opened with considerable ceremony on Friday last. For many years the need of a bridge has been much felt in the district, the communication across the river being by means of a ford, which was frequently impassable and often dangerous. Year after year Glen Clova has increased in popularity as a holiday resort, and up till now, for want of a bridge, driving parties have been largely restricted to one side of the beautiful glen. The bridge itself, which is according to plans prepared by Mr. Donald Ross, road surveyor, is a handsome structure. It has a span of 45 feet, and is built of local whinstone with cement foundations, the hewn work being Kirriemuir stone. The cost of the bridge was about 700*l.*

THE Yorkshire district meeting of the Incorporated Association of Municipal and County Engineers took place at Sheffield on Saturday. Members of the profession from all parts of the country attended in large numbers. The visitors were welcomed to the city by the Lord Mayor (Mr. Alderman Clegg), with whom they afterwards lunched. After a discussion on a paper by Mr. C. F. Wike, on "Ten Years of Municipal Work in Sheffield," the party spent the remainder of the day in visiting various public works under the control of the municipality.

THE new premises for the Y.M.C A., at Bedford, are completed, and form a conspicuous pile of buildings, of which the town may well be proud. The architects are Messrs. Mallows & Grocock, who are to be congratulated upon the satisfactory realisation of their ideas. The builder, Mr. T. H. Coleman, of Foster Hill Road, Bedford, also deserves praise for his part of the work. The buildings have been so constructed that the outside of the ground floor is composed of shops, the Y.M.C.A. premises being behind and above these. The large hall on the first floor will be available for the public, upon occasions as well as for Y.M.C.A. meetings. This hall is capable of seating some 500 persons. There is a gallery at one end; opposite is the platform, which is placed in a sort of stage recess which is admirable as regards acoustics. Behind the platform end of the hall is an ante-room and a ladies' cloak-room there is a suite of five rooms called the café suite, a public bar a ladies' room and a members' room. The kitchen has been constructed on the top of the building, with a view of preventing cooking smells, &c., pervading the premises. The resources of the café are large; some 100 persons can be, if necessary, accommodated to dinner and 200 to tea. There are four bedrooms provided, and a caretaker's suite of rooms, well fitted with every convenience. The members' suite of rooms comprises a Bible-class room, social-room, reading-room, which can be united into one large room by the sliding back of a couple of patent partitions. Lavatories and other conveniences are also provided. Upon the ground floor is a gymnasium, and opening off from it a dressing-room, lavatories and shower-bath.

THE formal opening took place on the 3rd inst. at Horton near Epsom, of the Manor Asylum, erected to accommodate 700 patients. The site was purchased by the London County Council in 1896, and consists of 1,060 acres of beautifully wooded ground, for which 40,000*l.* was paid. Ninety-four acres of the land have been appropriated to the present asylum, and the old Manor House, which forms the central object in the group of buildings, has been enlarged and adapted for the residence of the medical superintendent, Dr. F. Bryan, two assstant medical officers, a matron, Miss Morgan, five sub-officers, and sixty-two nurses and servants. The old stables and coach-house have been converted into the laundry. On either side of the Manor House temporary buildings have been erected for the patients, which consist of structures framed in wood, having brick foundations, the exterior walls being of corrugated iron, with layers of felt between the wood and iron. The buildings for the use of the patients are all one storey high, and each block has a separate scullery and store-rooms. All the wards have a pleasant outlook. The recreation hall is a fine structure which will seat 400 people, and here religious services will also be conducted. The water supply comes from a boring 450 feet deep, and the lighting is by gas. Workshops, laundry, kitchen, and all other buildings necessary for the enterprise, are constructed and fitted up in accordance with the

latest demands of science. There is a block for chronic cases which will house 110 patients, and two infirmaries which can receive fifty-nine cases each. The 700 patients for this asylum will be distributed amongst eight blocks, of which three are already finished. For the portion now opened a sum of 112,000*l.* will be expended. The building works of the Horton main Asylum, now in progress, for 2,000 patients, is not included in the amount.

THE new Birmingham library, which has been erected at the corner of Margaret and Cornwall Streets from the designs of Messrs. Cossins, Peacock & Bewlay, and will replace the old premises in Union Street, is to be opened to-morrow (Saturday). The new building is in a quiet and restrained style appropriate to the uses to which it is dedicated. The elevations are in the English Renaissance style, carried out in Ruabon brick and white Hollington stone, with Westmoreland green slates for the roof. The building consists of two blocks at right angles the one to the other. On the Margaret Street side the façade of two storeys is divided into three sections—a gabled portion at each end—and between them a slightly recessed division, further subdivided by piers between the windows. The porch is of stone, and the large circular-headed windows have stone mullions and borders, the arches being broken by key blocks. Over the entrance appears in incised lettering the Latin motto which appeared upon the front of the old building, which has been the home of the library for close upon a century—"Ad mercaturam bonarum artium profectus et tibi et omnibus ditesces." To the right of the doorway, which is closed by a wrought-iron sliding gate, is a tablet recording the dates relating to the new and to the old building; while on the left is a window giving light to a small apartment which is to be used as a telephone call office. Upon entering the visitor finds himself in a spacious hall, upon the further side of which is the segmental counter of the book-issuing department. To the left, and having windows opening on one side to Margaret Street and on the other to the area at the back, is the main lending-library apartment. The shelves are not against the walls, as was largely the case in the old building, but stand out right and left of a central avenue. They are wooden adjustable shelves, on steel frames, on the latest system, supplied by the Library Bureau of London. The room is beautifully light, and the light reaches the whole of the shelves. In the block which has its windows to Cornwall Street are a series of rooms devoted respectively to the clerks, the librarian and the committee. These, while *en suite*, have their separate doors to a corridor, upon the opposite side of which is the lady subscribers' room and lavatories. Ascending by a staircase to the upper floor, access is obtained to the general reading-room, 54 feet by 35 feet, and a conversation-room, 38 feet by 23 feet. These two rooms are divided from one another by sliding doors, which enable the two to be thrown together for purposes of assembly if occasion should require. The reading-room has a portion of the ceiling coved with exposed timbers ornamentally carved, adding greatly to the handsome appearance of the apartment. It is stated that it will constitute the finest general reading-room to be found in any proprietary library in the kingdom. It is proposed that it shall be used both by gentlemen and ladies—the ladies' separate rooms not being supplied with papers. Upon the Cornwall Street side of the upper floor has been arranged a room for rare books, and the smoke-room and ladies' retiring-room reserved for the special use of proprietors who pay the extra subscription. To each of these there is additional lavatory accommodation. Above these on the attic storey are storage rooms for books. A very roomy basement contains a library for the books less in request, binding-room, clerks' messroom, caretakers' residence and the heating appliances. In the yard, approached by an inclined plane from Cornwall Street, is a large shed for the storage of cycles, a convenience which will doubtless be very highly appreciated by many who use the library. The arrangements altogether show that they have been the subject of much well-directed thought on the part of the architects, librarian and committee. The internal woodwork is of pitch-pine, adamant plaster is used for the principal walls, and wood blocks are used for flooring. Electricity is used for lighting the whole establishment and there is not a gaspipe in the place. The cost of the new library is about 10,000*l.*, and the builders (Messrs. J. Barnsley & Sons) have been engaged upon the work just over a year.

THE Right Rev. Dr. Brindle, D.S.O., Bishop of Hermopolis, and auxiliary to the Cardinal Archbishop of Westminster, performed on the 25th ult. the ceremony of opening the new church which has been erected in connection with the Franciscan convent at Bocking, Essex. The new building has been carried out in the Gothic style of architecture, with a belfry at the side, the materials used being red facing bricks with stone dressing, and windows of cathedral tinted glass. It comprises, in addition to the church, all the necessary accommodation for the nuns.

NEW CATALOGUES.

MESSRS. CHARTERIS & LONGLEY'S new illustrated price list contains a full, and even elaborate, description of their patent system of wood-block flooring, and the explanation is rendered clearer by the aid of sections and diagrams. The advantages claimed for this kind of floor are many, among others that it is firm and level and has a much superior appearance to the ordinary boarded floor; that it is also more durable, noiseless, sanitary, fire-resisting and, if properly laid, damp-resisting; that its use converts cold, damp basements into comfortable kitchens, offices, or warerooms, and, occupying less space than ordinary boarded floors, gives greater headroom; and that if the entire construction be on modern fireproof principles the architect is able to give loftier ceilings, or more than save the cost of wood-block floors in the reduced height of buildings.

MESSRS. YATES, HAYWOOD & CO., of 95 Upper Thames Street, have sent us their catalogue, which in the new edition attains proportions which are truly monumental; nor is the size in any wise disproportionate to the quality, which is excellent. Many of the illustrations are in artistically-executed chromo-lithograph, while those which are in black and white are of commendable sharpness and finish. An excellent feature in the arrangement of this catalogue, and one which will greatly enhance its value as a book of reference, is the linen-protected marginal index to the various sections into which the book is divided. These relate to stoves and interiors, dog stoves, mantels, fender curbs, kitcheners, gas stoves, stable fittings, garden seats, air stoves, gates, railings, verandahs, brackets and cantilevers, staircase balusters, spiral staircases, ventilators, manhole covers, window frames, &c., &c. All these diverse sections are fully illustrated, and all prices are given, and the book, which consists of some 460 folio pages, will be found invaluable to users of the various articles and appliances described.

THE new catalogue which has reached us from Messrs. Thomas Crapper & Co., of Chelsea, is an excellent example of careful compilation and attention to detail. It contains upwards of 160 pages, on each of which appear carefully-executed drawings of the various sanitary wares and appliances for which the firm is known. These, it is hardly necessary to remind our readers, comprise drain-pipes, channels, bends, traps, junctions, chutes, frames and covers, ventilating and other valves, &c. Drain-testing plugs, sinks of various descriptions, closets, lavatories, baths, boilers, radiators, taps, cocks, and garden fittings. Messrs. Crapper & Co. notify u that having their works well equipped with modern machine and a staff of skilled workmen they possess exceptiona facilities for executing with speed and efficiency any repair connected with valve closets, water waste preventers, bath and lavatories, water, steam and gas fittings, &c.; and as the foundry adjoins the works, and possesses many other advantage castings can be supplied from customers' own patterns.

FORESHORE GROYNES.

AT a meeting of the Society of Engineers, held at the Roya United Service Institution, Whitehall, on Monday evening June 5, 1899, Mr. John C. Fell, president, in the chair, a pape was read by Mr. R. G. Allanson-Winn, entitled "Foreshore Pro tection, with special reference to the Case system of groyning.

In introducing the subject the author referred to the advan tages of utilising the destructive forces of the sea for construc tive purposes, and stated that his object was rather to give a account of what had actually been accomplished in tha direction than to advance his own opinions or theories. Deal ing with the question of changes constantly going on in th configuration of the country, he took as an example 30 miles o the Yorkshire coast, and calculated that, at a moderate com putation, over 47,500,000 cubic feet of material were annuall taken from the coast between Flamborough Head and Spurn Point. Where did it all go to? Much was doubtless deposited at the mouth of the Humber, greatly to the detriment of tha estuary, and probably more was carried down southward by th flood tide, and deposited along with material eroded from th Lincolnshire coast in the Wash which was gradually silting up The erosion, in the shape of falling cliffs, was noticed now and taken account of; what did not so readily meet the eye was th gradual deposit beneath the sea, and this accretion of silt would suddenly show itself some time next century, when possibly 100,000 acres of land in the Wash would suddenly by compari son spring into existence, and be added almost at once to the acreage of England. Taking one century with another we did not probably gain or lose much of our area. The addition o 100,000 acres in the Wash alone would make up for a good many years of cliff erosion.

Having briefly quoted certain conflicting opinions on the moot point of the travel of beach at various depths, the author

endeavoured to show that, as Dungeness Point was steadily moving out into 100 feet of water, there was strong evidence that shingle, of which the point is entirely composed, is capable of motion in water at least 100 feet in depth. Allusion was then made to the unprecedented encroachment of the sea during the past year at Glenbeigh, on the southern shore of Dingle Bay, co. Kerry, an average of 120 feet being recorded for a distance of over 2,000 feet. The problem here involved the protection of about 600 acres of land and some house property. The situation was one of exceeding gravity, and it had been decided to put in the groynes invented by Mr. Edward Case, of Dymchurch, because this system of low groyning had been so successful at other places where the natural difficulties were greater.

Having alluded to the usually accepted methods of dealing with the question of foreshore protection, Mr. Winn pointed out that these oft-repeated and usually accepted methods had frequently met with but indifferent success, and that until Mr. Case brought out his system no one had ever promulgated a scientific theory as to the curve at which a shore should lie, and had also devised a simple and inexpensive form of groyne which should cause the sea itself to build up that shore to its required curved surface of repose. Mr. Case was able, by means of tables which he had constructed and the due consideration of certain details, such as range of tide, nature of shore, sections, &c., to build up any shore, save only an actually rock-bound coast, to an angle at which it would lie with the minimum chance of erosion or alteration of form.

The paper was illustrated by diagrams showing, by means of sections, the actual gains at Dymchurch, Deal, Southwold, Lowestoft and Sheringham—which places were selected from a great many where the system had been successfully applied. The author contended that the invention was to be recommended by reason of its theoretical soundness, its practical utility and economy, and by its success.

PAVING OF TOWNS.

A PAPER was prepared by Mr. C. F. Wike, city surveyor, Sheffield, for the benefit of the members of the Incorporated Association of Municipal and County Engineers who visited the city on Saturday. In it was described some of the municipal work carried out in Sheffield during the last decade in connection with his own department. Mr. Wike said, with certain exceptions, the main streets were twenty years ago narrow and tortuous. That description still applied to some of them, but great improvements had recently been made both in width and line, and those were still going on on an extensive scale. The gradients, while favourable for purposes of drainage, made the question of a suitable form of paving a most difficult one, and there was a great variety of pavements in Sheffield, as the following table showed: — Wood, nearly 3 miles, about 2 miles of which had been laid since January 1898; granite, 21½ miles; Inverkeithing, 1½; gritstone, 21½; boulders (a local name for small rough sets), 47½; tar macadam, 7½; dry macadam, 212: a total of 314½ miles. The proportion of macadam, unfortunately for the district rate, ranked high, and cost was not the only disadvantage. Many streets had gradients of 1 in 10, 1 in 8, and even 1 in 5, and when there was a heavy rainfall the macadam could not remain upon the surface of such streets, but was washed either upon the low-lying roads or into the sewers, from which eventually it had to be removed at great cost. About 300,000 tons of macadam had been used during the last ten years, a large proportion of which had disappeared in the shape of dust, or had been carted away as mud or deposited in the sewers. In Sheffield the cleansing of the central parts of the town was done by a separate department, and only the outlying roads by the Highway Department. In his opinion, however, the maintenance and cleaning of macadam roads should be in the same hands. Trial lengths of the different pavements laid in Sheffield had been carefully watched, and the figures so obtained were as follows:—Life in streets of heavy traffic: Granite, average at least twenty-one years; wood (red), average about seven or eight years; gritstone, rarely more than five or six years in main streets; tar macadam in busy suburban road over four years; dry macadam entirely according to traffic and other conditions. The last remark applied with almost equal force to the other pavements. It was a most difficult matter to give reliable average lives for pavements, and to make the information really useful it should be accompanied by figures as to amount and nature of traffic, gradients, width of road and other local conditions. Where wood was laid against tram rails the life was very uncertain. Pavement of this class laid in Sheffield within the last nine months was already grooving, as well as gritstone and Inverkeithing laid about the same time. With regard to gritstone, which was practically a local stone, numerous experiments had been tried with a

view to prolonging its life under heavy traffic. Concrete foundations had been used, both by himself and his predecessor, but these had proved a failure. In one main street, paving of this kind laid on concrete was thoroughly worn out in 3½ years. In another street, forming part of a tram route, 7-inch Lancashire sets had been laid on concrete, and the result was being closely observed. So far, the most satisfactory foundation for gritstone seemed to be hand-pitched rubble, with bedding of hard chips. Within the last few years a whinstone from the Inverkeithing quarries had been introduced into Sheffield, and had found favour on account of its quietness and non-slipperiness. It, however, wears very rapidly, especially under traction-engine traffic or along tram-lines. In one case where it was laid under the latter condition it wore ¾ inch below the level of the rails in less than twelve months. The paving immediately abutting upon the rails was then taken up and relaid with a "hit-and-miss" course of granite sets next each rail, to equalise the wear a little. It is now less than two years since the relaying, but the Inverkeithing was from 1½ inch to 2 inches below the level of the granite, and must soon be taken up. His experience tended strongly to prove that no material would stand next to tram-lines but granite, and even that after a time became grooved.

Mr. J. P. Barber (Islington), in moving a vote of thanks to Mr. Wike for his paper, said he quite agreed with that gentleman that the maintenance and cleansing of macadamised roads should be in the same hands. Mr. Wike had treated gritstone sets in the best possible way, yet that had very little effect in prolonging their life. With a stone of such a nature it mattered very little whether it was put on a concrete or a rubble foundation, because that did not affect the wear of the surface of the sets by the traffic. There was no question what kind of sets should be used on streets subject to heavy traffic. As between gritstone and granite there could be but one opinion. If a satisfactory road and true economy were aimed at, one must use granite on roads over which there was heavy traffic. He came to that city expecting to find it a long way behind in respect of the paving of its main thoroughfares, but was agreeably surprised to find they were paved and maintained in a manner which would not discredit one of the best and most populous districts of the Metropolis—the district he represented. The wood in Sheffield had evidently been laid down by someone who understood the requirements of the case, and had brought to bear on the work great care and skill.

Mr. E. G. Mawby (Leicester) seconded the resolution. He said Sheffield could not have a better authority than its city surveyor as to what was best for the paving of the city, and he did not think the Corporation could do better than stick to granite and wood. With regard to the bacterial treatment of sewage, it was gratifying to hear that the results of Mr. Wike's experiments were satisfactory, and he believed there was a great future for the system.

Mr. F. Baker (Middlesbrough) advocated the use of wood as the best for streets lined with shops, and explained that in the district under his control every alternate block next the tram rail when in a wood street was of chilled iron.

Mr. Pritchard (Birmingham) agreed that the paving of Sheffield was second to none in the country. They could not suggest as between the use of granite and wood, for no gentleman was better qualified to do that than Mr. Wike, who knew the class of traffic which the pavement had to withstand.

Mr. Price (Birmingham) contended that it was a question of policy for a corporation whether the town could afford to pay for a certain class of pavement or not, and not for the surveyor to decide. The official who was responsible for the repair of the pavement should also be responsible for the cleansing of it, and should have under him the sewering arrangements.

The president (Mr. Claude Robson), in supporting the resolution, said on the per unit of traffic, and not necessarily the aggregate traffic, granite sets were distinctly cheaper than wood, and in London they would be using granite if it were not that the people were more neurotic than the people in the north.

The resolution was carried with acclamation.

Mr. C. F. Wike, in returning thanks, said all the work had not been done by one man, and he had to thank the members of the City Council for the great support they had given him during the last ten years, without which he could not have got along at all. He also desired to acknowledge the hard, conscientious work done by his staff. Some of them had left Sheffield in order to take up better positions elsewhere, and he was glad to see some of them taking part in that meeting.

BRIGHTON TOWN HALL.

THE extensive alterations which have been in progress at the Town Hall, longer than some people care to contemplate with complacency, are nearing completion. The central hall, says the *Sussex Daily News*, is still a mass of scaffolding from floor

to roof, and though it may seem to the uninitiated that there remains enough to be done to keep the large staff of workmen busy for months to come, experts are able to say a few weeks will suffice to put the finishing touches. The work was commenced in January 1897, but has been much delayed owing to the fact that the building could not be given over absolutely to the contractors, who have had to undertake the structural alterations in sections. The contract price was 30,000*l.*, but extras have swelled it considerably. A strong feeling still obtains that the wiser plan, and perhaps the cheaper in the long run, would have been to build an entirely new town hall; but, be that as it may, an inspection of the work proves that the best has been done under the circumstances. There is little that one familiar with the old building will recognise in the new with the exception of the exterior, though even this has undergone considerable alteration, a new wing having been added on the east side of Bartholomews and an extension into Market Street also carried out, to say nothing of the vast improvement in the lighting by the inletting of a number of additional windows. Inside scarcely a trace of the old order of things is to be found. The council chamber stands "where it did," but that is about all.

The Town Hall proper and other rooms which adjoined it have been swept away and utilised in the provision of an imposing suite of committee rooms; the town clerk's corner overlooking Market Street is now the happy hunting ground of the rate collectors and the accountant's department generally, and where stood the old police-court and police-station the town clerk and his assistants now hold sway. The surveyor's department and the medical officer of health and his staff are located in the east side of the buillding, and generally speaking the offices have been admirably mapped out. Practically all the departments are already installed in their new quarters, and the confusion and wild state of chaos that formerly existed, owing to the ill-adapted nature of the building, have given place to perfect order and system. Each department has now ample accommodation, adequate apparently for all time, with the single exception perhaps of the accountant's staff, whose numbers have appreciably increased since the plans were drawn, and who appear, by comparison with other branches, to be somewhat cramped. Some inconvenience, too, may result from the surveyor's department having offices on several different floors, but otherwise the plans seem to be incapable of improvement. Taking the offices as a whole they are fine lofty apartments, and all heads of departments have private rooms. Most of the fitting has yet to be carried out, but will be in keeping with the good taste with which everything else is being done, and the public will be interested to know that all departments are easily accessible from the main entrance. This, as formerly, will be on the north side of Bartholomews, and once in the entrance hall one will be confronted by the main staircase, on the completion of which workmen are now so fully occupied. It is a very imposing bit of work, with a marble tread, fine columns, and ornamental balustrading, and leads to a series of galleries which open on to the various offices and rooms on each floor, the floors being also connected with an hydraulic lift. A very noticeable improvement in the central hall is that of light, gained by the insertion of a lantern light in the roof. A general idea of the arrangement of the new building can perhaps be best conveyed by an allusion first of all to the sub-basement. This has been utilised for store and strong rooms for the various departments. In the basement the new wing extended to the eastward houses the police force and a section of the surveyor's staff, and it should be pointed out that none of these offices are underground, being on a level with the east side of Bartholomews.

On the ground floor are the new police-court, with an adjoining suite of rooms for the use of the magistrates, counsel, witnesses, &c., the town clerk's general office and offices for the sanitary, rate collecting and accountant's departments. A prominent place is given on the first floor to the mayor's parlour. This opens out on to a balcony in the new east wing, and has been tastefully upholstered, while the walls are adorned with portraits of some of Brighton's public men. On the same floor are the mayor's reception-room, one of the finest apartments in the building, and more offices for the town clerk, surveyor and accountant, and gallery of the police-court. The council chamber and committee-rooms take up nearly the whole of the accommodation on the second floor, with the exception of another section of the surveyor's offices. The council chamber has been enlarged by extending the west wing into Market Street, while the wall on the east side has been thrown back for the purpose of forming an ante-room for members of the council. There is still a good deal to be done in the council chamber, although the work may be said to have reached an advanced stage. It will be the only apartment in the Town Hall, besides the police-court, entirely fitted in oak, and will have entrances, the principal one being through double doors from the central staircase. This will be for the members' use, the public staircase being on the west side and

TO ARCHITECTS, SURVEYORS, &c.

The Original Patentees and Sole Manufacturers of the MICA VALVE CHIMNEY BREAST VENTILATOR (patented by Comyn Ching & Co. under the name of "Thomas Boyle's Patent") having suffered for some time past by WORTHLESS IMITATIONS being supplied to Builders and others, which are badly fitted with inferior materials, neither Smoke-proof nor Proof against back-draught, are very noisy in action and soon get out of order,

Beg to call the attention of the Profession to the following fact:—

The only Perfect Ventilators have the Patentees' MONOGRAM CAST IN the front, and the only GUARANTEED NOISELESS is Ching's NEW PATENT SILENT Chimney Breast Ventilator with the NAME and MONOGRAM CAST IN.

TRADE MARK.

Any Infringement of the above Patent or Trade Mark Monogram will be subject to an action at law.

ARCHITECTS SHOULD SPECIFY

CHING'S Patent Mica Valve Chimney Breast Ventilator, or CHING'S New Patent Silent Chimney Breast Ventilator.

TO BE HAD OF ALL IRONMONGERS AND VENTILATING ENGINEERS IN THE UNITED KINGDOM.

entered from Market Street. The members' seats are raised and in three rows of semicircular shape, the mayor's chair having been moved from the north to the south side of the room. Above him is a new press gallery, reached by a spiral staircase. The accommodation on the third floor comprises the surveyor's drawing offices, custodian's apartments and store-rooms. The building will be heated throughout by hot water, and lighted by electricity.

LINCOLN MASTER BUILDERS' ASSOCIATION.

THE inaugural dinner of the members of the above Association was held at the Spread Eagle Hotel, Lincoln, on Thursday night, and was a great success in every respect. To begin with there was a large attendance. Host and hostess Lakin provided a most excellent repast, which was well and quickly served, the tables were nicely decorated, the new room provided ample accommodation, and what added much to the comfort of those present was that it kept at an even temperature. The chair was occupied by Mr. W. H. Close. Regret was expressed at the absence of Mr. M. Otter, the hon. secretary, through indisposition.

The loyal and patriotic toasts were given from the chair and heartily received, Mr. Wellsman responding for the "Army, Navy, and Reserve Forces."

Mr. J. M. Harrison proposed "The Mayor and Corporation," remarking that he knew all the members quite well, and he was of opinion they had a very good Mayor and a good Council.

In the absence of a member of the Corporation, Mr. W. Watkins, an ex-mayor of the city, responded. He alluded to the tremendous changes which had taken place in the city during the past forty years or so, pointed out how it had developed and been improved in matters of sanitation and in the streets. In giving a word of praise to the electric-light installation, the speaker evidently had in mind some adverse criticism which had been made, for he said that the arc lamps were never quite steady, but he believed those in Lincoln were steadier than almost any others he had seen, and that he regarded as a great achievement on the part of the electrical engineer, as the installation had only been recently put down. As to the disposal of sewage he thought the Corporation had adopted the natural and proper treatment in the construction of bacteria tanks, and he also expressed approval of boring for water near the pumping station, a course which he advocated fifteen years ago. The boring, he added, would certainly have to be a deep one, but when the strata was tapped we should have a splendid water for domestic purposes. He might, perhaps, cavil at the Corporation in matters of municipal architecture, and he hoped to see an advancement in that direction. At some length he condemned the scheme to place slaughterhouses on the hill side above the cattle market; his remarks seemed to meet with general approval.

The Chairman gave the toast of "The Lincoln Branch of the National Association of Master Builders of Great Britain." He said although that was the inaugural dinner, the Association was not a new one. Twenty years ago, when he first became acquainted with the building trade of the city, there was a very flourishing Master Builders' Association, but, alas! many of their members had passed away, and others had either left the city or retired from business. Some years ago a time of depression set in, and the Master Builders' Association declined, but it never died out. It was kept alive by two of the present members of that Association. In February of last year certain labour troubles arose in the city, and it was felt advisable by certain builders in the city to revive the Association, reorganise it and bring it into a flourishing condition. That had been done, and it was a pleasure to him to preside over that large gathering of builders and kindred trades. The Association had been of great value to the members. They had been able to meet together and express their individual opinions, they had become better known to each other and there never was a better feeling existing amongst the trade than at present. Trade troubles had occurred during the year, but they had been able to speak with a united voice, and they had been able to amicably settle differences between their operatives and themselves. There was now a feeling of mutual confidence and respect between them, and that had to a great extent been due to the Master Builders' Association. He considered he was justified in saying that arbitration would always be found to be better than the taking of drastic measures.

Mr. S. Horton, in appreciative terms, proposed "The Architects."

Mr. W. W. Watkins, in response, made an interesting and instructive speech on the value of technical instruction in the building trade, and gave instances in which he himself had had to show a workman how to do his work in a manner which would save an immense amount of time. He urged that it was

essential that every trade should be properly taught and learnt, and deplored that many artisans thought they were fully competent when they had been at a trade a year or two. If they had systematic education in all branches of trade they need fear the competition of no foreign country.

Mr. Cooper and Mr. Dunn also replied.

The other toasts were "Kindred Trades," "The Visitors," "The Press" and "The Chairman." The toast list was pleasantly interspersed with songs.

CUTTING STEEL GIRDERS BY ELECTRICITY.

THE Moulton Starratt Contracting Company, of Chicago, while engaged on the reconstruction of the New York Life building in that city, found it necessary to cut through six steel I-beams, each 15 inches high with a ½-inch webb and 6-inch flange varying in thickness from ¼ inch at the outside to 1 inch at the centre. The point at which the cut was to be made was located in such a position that it would be necessary to have special saws made, and as three I-beams of this size side by side would not cut very easily, it was estimated that in addition to the time required to make the special saws it would take two men at least two weeks at 3.50 dols. a day to saw them off. This loss of time in finishing the job and the expense involved were important considerations, and when it was suggested to Ralph Starratt, superintendent of the contracting company, that inasmuch as a smooth cut was not necessary, it might be feasible to get the girders burned off with the electric arc, he placed the matter in the hands of Clyde J. Coleman, of the Coleman Laboratory of Experimental Engineering. Mr. Coleman has done considerable work in the line of electric arc burning for the purposes of getting into safes and vaults with broken locks, and for cutting new doorways in vaults already in place, and also as an interesting experiment to demonstrate the possibilities of safe burglary by this method. Mr. Coleman pronounced the plan of burning off the I-beams perfectly feasible, and undertook the task. The time actually required for electrically burning off the six girders was about twelve hours, and from four to five hours more were spent on mechanical work, such as removing girders to get at the remainder. The electric arc, therefore, did in two working days what would have required from two to three weeks by the usual method, resulting in a great gain of time for completing the remainder of the job.

The plan of operation, as described by the *Western Electrician*, is very simple. Current was applied at 110 volts from one of the dynamos in the plant of the building. The current used was about 350 amperes. The positive side of the circuit was grounded on the structure of the building, and the negative connected to a carbon holder containing a 1½-inch round carbon. The carbon holder had a wooden handle. The operator struck an arc between the spot on the iron to be melted and the carbon. The light and heat were intense, and the effect was very disastrous to the eyes where proper precautions had not been taken. The arc is usually covered over with a muffle, consisting of an asbestos lined iron box, with a hole in the back just large enough to admit the carbon used. The box is placed against the iron to be burned, and the carbon thrust through the hole and the arc drawn. In places where there is not room for the box the carbon is simply thrust through a shield consisting of a sheet of heavy asbestos board. Some resistance has to be placed in the circuit, as is the case with any arc working on a constant potential circuit. The resistance used in this case was simply a few turns of German silver wire placed in a pail of water under a faucet, from which it was constantly replenished.

PATENT VULCANITE ROOFING.

AT the Edgware Petty Sessions on the 17th ult., before T. Bridgwater, Esq., and Messrs. H. W. Nelson, J. E. Lilley, W. Hannaford and H. Lovejoy, Mr. William Martin, builder, of 7 Rockhall Road, Cricklewood, London, N.W., appeared to the summons issued by Mr. S. S. Grimley, district surveyor to the Hendon District Council, for having eleven houses covered with vulcanite roofing.

Mr. Bevir appeared for the District Council, and Mr. Blackwell for the defendant.

Mr. S. S. Grimley, district surveyor, and Mr. Reid, building inspector, gave evidence contending that in their opinion the vulcanite roofing did not comply with the by-laws, which specify that the roofs of dwelling-houses should be covered with slate, tile, metal or other incombustible material.

Mr. Blackwell then said that he would clearly prove that the roofs were covered with a material that was incombustible, and called evidence to show that the material was largely used.

Edward Elliot, superintendent of the Wolverhampton Borough Fire Brigade, gave evidence as to a test carried out

by the fire brigade of the borough. Several roofs composed of slates and vulcanite were simultaneously set fire to in the presence of a committee of the Corporation, and the vulcanite roof withstood the fire longest. He did not go on the roof, but after the slate roof was completely burned down several men went on top of the vulcanite roof, thus proving that it was still quite strong and solid, although charred beneath. A fireman brought him a piece cut out after the fire, and in his opinion it was the same material as used by defendant.

James Thompson, architect, of Southend-on-Sea, said he had used this material, with a top layer of ballast and sand, on a large number of buildings, and that he was using it on the Corporation Buildings at Southend-on-Sea at the present time. It was, in his opinion, the best material that could be used as a protection against fire. The roof of the public baths was composed of this material, and also that of other buildings.

Alfred Harmer, builder, of Lower Clapton, said the roof of his back addition was composed of 1-inch tongued flooring, a layer of vulcanite and then the earth. The roof was used as a garden and recreation ground with flower-beds. He had often burned rubbish on the top without any injurious result. On May 9 a fire broke out at the house, and it was completely gutted with the exception of the flat roof, which remained intact. A table and chair on the roof was burnt by the flames which were blown across it, but the roofing was untouched.

William Clinch, an officer of the Law Union and Crown Insurance Company, said that some houses containing roofs of this kind were insured by the company, including that of Mr. Harmer. He saw the roof referred to after the fire, and agreed with what the last witness had said.

Peter Wood, builder, of 177 Ashmore Road, Paddington, said he built two houses three or four years ago, with roofs composed of this material, and he had also built in other parts. The district surveyor of Paddington had passed his plans and, so far as he knew, saw the houses built. He had two flats and a large workshop in Willesden, but they had not yet been passed by the Willesden District Council.

W. H. Martin, son of the defendant, said he laid the roofs, first with rough boarding, then vulcanite and then the earth. He had been on top before coming into Court, and had found that the ballast was gradually going into the soil and the material was becoming quite fast, and that there was no fear that the soil and ballast would blow or wash away.

By Mr. Bevir: The boarding underneath was not tongued, but put close together.

George Max Beer, managing director of the London branch of the company manufacturing the patent roofing, said that they were supplying thousands of yards to the War Office, that their own works at Bow were covered with the material, and were passed by the district surveyor, and that it would last for years.

The Bench retired for a few minutes, and on returning the chairman said they had paid every attention to the case, and without adding from what they had heard, the Court decided to dismiss it.

Mr. Blackwell applied for costs, stating that he had witnesses' fees which would come to 14*l.* 14*s.*

The Bench allowed 20 guineas costs.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

APPLICATIONS FOR PATENTS.

10752. Thomas Alexander Currie and George Edward Currie, for "Improvements in machines for dressing stone."

10905. Marc Perret, for "An improved adjustable support for the scaffolding or framing used in building concrete floors and the like."

11030. Alfred Paget Humphrey, for "Improvements in or relating to the securing of gates, doors and the like."

11039. Alfred William Turner and William Alfred Turner, for "A mechanical bricklayer, for use in automatically laying, cementing and levelling bricks, slabs, stones and the like in the construction of fortification, piers, bridges, viaducts, warehouses, dwelling-houses and buildings of every description."

11052. Emil Wonsowski, for "A new or improved door-fastening device."

11066. James Boardall, for "A new or improved weather-bar for windows."

THE WEEK.

In the course of the discussion in the House of Commons on the Bill promoted by the Dublin Corporation for the purpose of extending the city boundaries, Mr. T. Healy said that the late Sir Herbert Stewart, who was killed at Abu Klea, furnished an entire terrace of houses in London with the doors and chimney-pieces which he had quarried out of old Dublin tenements. There may be some exaggeration in the statement, but it is a testimony to the good taste of the warrior. Dublin houses have been subjected to many vicissitudes like those in other cities and towns. But the difference between past and present is more marked than elsewhere. Soho, for instance, is no longer what it was, still it has not fallen into the degradation that is witnessed in the district of Dublin known as the Liberty. Many of the houses were as fine examples of "Queen Anne" as could be found; the carved woodwork, plastering and tiles were unsurpassed in Great Britain. Members of the Meath family lived there, and some of the wealthy traders of the city also thought it was a sign of respectability to have houses near them. By degrees the character of the district altered, and eventually almost every room was occupied by a different family. Woodwork and tiling were destroyed or carried off, but it is still possible to discover fragments which will suggest the former appearance of the houses.

A time when preparations for war cannot be neglected does not seem opportune for bringing forward a project for a tunnel between England and Ireland. There are, however, obligations which greatness imposes, and as at the period it was considered necessary to uphold English reputation by sacrifices to discover the North-West Passage, early in the next century, if peace can be assured, a tunnel under the Irish Sea may be accepted as a duty. The passage would never yield sufficient profit to tempt speculators, although schemes as uncertain constantly come into the market. That a tunnel could be constructed between Scotland and the North of Ireland is likely. There might be occasional mishaps, but eventually the difficulties would be overcome. What is uncertain is the gain of time. London must be considered the starting-point of all such enterprises, and the difference between a journey from it to Stranraer and from Islandmagee to Dublin must be compared with one from London to Holyhead followed by a sea passage. There is not enough attention given to the subject. Mr. Barton, the engineer, has mainly practised on Irish railways, but he is most cautious in what he says, and his anticipations can be accepted with more than the usual amount of confidence. It is characteristic that he does not minimise the difficulty arising from the difference between the Irish and British gauge, which for through traffic would make it necessary to put down a third rail on Irish lines, and the construction of special rolling stock if Irish carriages and waggons were to run on English lines.

In a little time we may expect to hear that contractors and other employers will insist on every workman who seeks employment from them filling up a schedule of his own and his ancestors' medical history, like those demanded by the insurance offices. In no other way is the amount of risk under the Workmen's Compensation Act to be realised. Judge Lumley Smith, Q.C., has decided in the Westminster Court that an employer took the risk of employing a man with gout in his system, and if an injury were received which brought out the gout the employer would be liable to pay the man compensation. The applicant was awarded 15*s.* a week, to date from a fortnight after the accident, which occurred on January 2, and to continue till further notice. The applicant was employed by Messrs. Sugg, and was struck on the hand by a hammer which was wielded by a boy. Miss-hits are not unusual, and are treated as trivial affairs, but the injury was aggravated in this case by the man's gouty condition. How is an employer to provide against such a contingency without the aid of information which would enable a medical adviser to diagnose the case of each workman? No less startling is a decision just given in the Court of Appeal. Since trade began in the world workmen have amused themselves by taking advantage of the ignorance of apprentices and boys. But a joke may now be the cause of the outlay of money by an employer. In the case we refer to (Brown *v.* Scott) a man told a boy that the foreman had left an order that he was to oil a machine while in motion. No such order was given, and oiling was not among the boy's duties, but there was the joke. The boy slipped and was injured. The County Court judge, although admitting that oiling was not part of the applicant's regular work, yet, as the accident arose out of and in the course of his employment, made an award in the applicant's favour. The employer appealed, but a majority of the Court declined to set aside the judgment. To meet such cases it will be necessary to discover workmen who have no desire to vary the monotony of labour by a practical joke, and we doubt if they are to be met with in this country.

There are so many parties connected with a Scottish church, it is difficult to bring them into agreement whenever building works have to be undertaken. The church of St. Leonard's parish, St. Andrews, offers an example. It is not in a sound state, and the questions arise, Can it be repaired, or must it be rebuilt? The "heritors" who will have to bear most of the expense are in favour of reparation. They have obtained an estimate from Mr. Henry, who says that by an outlay of 1,003*l.* 6*s.* 5*d.* (there is nothing like precision) the church can be made to serve its purpose. His conclusions are supported by Dr. Rowand Anderson and Mr. J. Kinross. The Presbytery believe that the heritors are eager to shirk their responsibilities, which should lead them to the rebuilding of the church. Mr. Kinross therefore was solemnly asked, "Can the ruin of St. Leonard's be made sufficient and serviceable and not injurious to health by anything that can be fairly and truly called repair, honestly regarded as the proper course, and not as a way of heritors evading their obligations?" The heritors refuse to do more than their architects consider necessary, and have adopted the following resolution:—"That Mr. Kinross, the architect consulted by the Presbytery, having corroborated the opinion of Dr. Rowand Anderson and Mr. Henry that St. Leonard's Church is repairable, the heritors renew their offer to repair the same in accordance with either plan, and if the Presbytery refuse to accept of same the heritors resolve to appeal to the sheriff against their judgment, and authorise the committee to employ a law agent to prosecute the matter." It remains to be seen whether the Presbytery will succumb.

Reports so persistently arrive about the discovery of the tomb of Romulus, it may be well to recall what the ancients thought on the subject. The oldest legends give two versions of the death of the founder of Rome. According to one he was assassinated at the Altar of Vulcan in the Forum, while the other describes his disappearance in a miraculous tempest which suddenly overspread the city. Preference is given to the former, but the scene of the murder was not the Forum, but a place called the "goat's swamp," where Romulus had come to negotiate with the Sabines. The two races were at war before as well as after the historic "rape." According to Dion, when the Sabines saw the murderer of their king they rushed on him and cut him in pieces. Possibly it was at the foot of the Quirinal the deed was perpetrated. Anyhow, a shepherd declared that Romulus was seen by him upon the Quirinal and announced he was then among the gods. The Sabines accepted the legend and raised a temple to the new god under the name of Quirinus. It is remarkable there was never a temple of Romulus, although the temple dedicated to "Venus and Rome" was sometimes taken for one. Nor was there a tomb of Romulus, for its existence would nullify the belief in his apotheosis. A tomb surmounted by a lion in the Comitium was called by his name, and in the Middle Ages one in the Transtevere was supposed to contain his remains, but there is nothing to support a belief that a black stone such as was lately found marked the place where the chief was buried.

WILLIAM MORRIS.*

WITH the exception of royalties, warriors and prominent politicians, there are few men who can expect their biography will be prepared and published in two volumes and the first edition exhausted in less than three years after they have quitted life. In the case of an artist there is sure to be dilatoriness. LEIGHTON and MILLAIS were generally considered to be of more importance than WILLIAM MORRIS, but memoirs of them have yet to appear. Artists are therefore to be excused who take time by the forelock and send out autobiographies under the title of recollections. MORRIS's life was known to be interesting on many accounts, and the curiosity to discover how the qualities of a man could be explained who was at once an aristocrat by feeling and a Socialist by conviction, a workman and a manufacturer, a poet and an economist, would inspire an interest in Mr. MACKAIL'S work. But that is not sufficient to account for its success. Much is due to the author. WILLIAM MORRIS was many-sided to an extent which has amazed the Germans, among whom such phenomena abound. His biographer should be able to appreciate the varied activity which was displayed in poetry, printing, glass-staining, dyeing, weaving, engraving, embroidery and other forms of production. Mr. MACKAIL has not only recorded but interpreted the works of WILLIAM MORRIS. He endeavours also to explain how and why MORRIS became an agitator—a task in which he could hardly hope to be convincing. But with all his admiration he does not allow his vision to be dazzled by his friend's achievements in poetry and industrial art. MORRIS was careful to admit among his *entourage* those alone who were disposed to idolise him. His equals or his superiors were avoided. Mr. MACKAIL, as one of the favoured few who were allowed to approach the pontiff, is not stinted in his admiration, but he does not hesitate to suggest the existence of shortcomings which of course affected whatever was said or done by the "poetic upholsterer." There was much in MORRIS which appeared puzzling to those who knew him only by repute or by occasional encounters, but the following analytical passage explains some of the apparent anomalies:—

> Morris had himself always been one of the people to whom personal matters bear far less than their normal share in life. He was interested in things much more than in people. He had the capacity for loyal friendships and for deep affections, but even of these one might almost say that they did not penetrate to the central part of him. The thing done, the story, or the building, or the picture, or whatever it might be, was what he cared about in the work of his contemporaries and friends no less than in that of other ages or countries; and in his mind these things seem to have been quite independent of the story-teller, or the architect, or the painter, and not merely substantive things, but one might almost say substantive personalities. So, too, in the ordinary concerns of life he was strangely incurious of individuals. On one side this quality of mind took the form of an absolute indifference to gossip and scandal, and a capacity of working with the most unsympathetic or disagreeable colleagues, so long as they were helping on the particular work in hand. On another side it resulted in an almost equally marked inconsiderateness. He sometimes seemed to have the aloofness of some great natural force. For sympathy in distress, for soothing in trouble, it was not to him that one would have gone. The lot of the poor, as a class, when he thought of it, had always lain heavily on his spirit. "Indeed, the poor man is always much at the mercy of the rich"—those noble and melancholy words, used just a century before by Johnson to Boswell, express a feeling which was at the root of all Morris's social doctrine. But the suffering of individuals often only moved him to a certain impatience. Many years before Rossetti, in one of those flashes of hard insight that made him so terrible a friend, had said of him, "Did you ever notice that Top (Morris) never gives a penny to a beggar?" Inconsiderate and even unscrupulous as Rossetti was himself in some of the larger affairs of life, this particular instinct of generosity was one which never failed him. For the individual in distress—were it a friend in difficulties or some unknown poor woman on the street—he was always ready to empty his own pockets, and plunge deeply into those of his friends. Morris's virtues were of a completely different type. Scrupulously just in his dealings, incapable of driving a hard bargain, liberal up to and even beyond his means in the support of an object which had gained his sympathy, he had not in his nature that touch of lavishness that gives a human warmth to generosity, and may elevate inconsiderate profusion into a moral excellence. That habit of magnificence, which to the Greek mind was the crown of virtues, was Rossetti's most remarkable quality. In the nature of Morris it had no place.

If nature has not enriched a man with the milk of human kindness and has frozen his blood, he is no more responsible for the privation than for his stature or the colour of his hair. There are crowds of excellent citizens who are as unsympathetic as was WILLIAM MORRIS and yet are respected. But they do not go about in a condition of diffusive philanthropy, nor pose as saviours of the world. MORRIS was assessed at his true value, and consequently he was the least convincing of street orators. The mob believed he was having a pastime at their expense, and, although ready enough to be duped, could not become game for a man whose sporting costume was an imitation of their everyday garments. Where he was most familiar he was treated as a living joke. According to his confession the meetings in his own district were dead failures, and the audience "hung on my hands as heavy as lead."

But MORRIS might well be excused if he imagined he was destined to set the world aright according to his own notions. Nature in leaving him heartless was otherwise bountiful to him. He was no "tortured torturer of reluctant rhymes," but a true poet. He was a dreamer from his childhood, and his endeavour was to make the world around him correspond with that which his imagination had created. Mediævalism was in the air, and MORRIS inhaled it with all his force. It is delightful to read of the delicate child riding about his father's park in Essex in a little suit of armour. We can imagine how doughty a knight he considered himself—for he had read all SCOTT'S novels and other romances before he was seven—and as a knight he was tilting real and imaginary evils to the end of his days. His father, who was a prosperous bill-broker, purchased a grant of arms, and the Heralds' College, where there is more humour than is supposed, assigned him in 1843, to the great delight of his romantic son, the following:—"Azure, a horse's head erased argent between three horseshoes or, and for crest, on a wreath of the colours, a horse's head couped argent, charged with three horseshoes in chevron sable." Henceforth the boy held himself to be a tribesman of the White Horse, and the family crest was as obtrusive in the decorations of his house as the coronet is on the noble's in HOGARTH'S picture. What a delight to him it was to discover a brass of one WILLIAM MORYS, a farmer, and another of the farmer's wife. From his name it might be supposed he was a Celt, and many of the characteristics of Celtic poetry which MATTHEW ARNOLD described are found in his stories in verse. But apparently he believed neither the Welsh nor Irish MORRISES bore the horse's head couped argent, and he therefore renounced all kinship with them and their poetry. As Mr. MACKAIL, his biographer, says:—"In spite of his Welsh blood and of that vein of romantic melancholy in him which it is customary to regard as of Celtic origin, his sympathies were throughout with the Teutonic stocks. Among all the mythologies of Europe, the Irish mythology perhaps interested him least: for Welsh poetry he did not care deeply; and even the Arthurian legend never took the same hold on his mind or meant as much to him as the heroic cycle of the Teutonic race."

At a later time he appears to have considered himself as one of the Northmen. He had one claim to the distinction. His fits of rage were at least equal in intensity to any of those recorded of Berserkers. To hear him talk of the sea he might have been a rover. And we learn how, when he first visited Iceland, "on the Law-Mound of Thingvalla by the steads of Herdholt or Lithend, he stood with deeper-kindled emotions than would have been roused in him in the Roman Forum or on the Athenian Acropolis, or where grass grows over the fallen towers of Troy." His account of the impressions which Iceland made on him is curious, for it is evidence of the failure of MORRIS to derive from the island any of the spirit of the old heroes. "It is an awful place," he wrote; "set aside the hope that the unseen sea gives you here, and the strange threatening change of the blue spiky mountains beyond the firth, and the rest seems emptiness and nothing else." Two years afterwards he renewed the experiment, and re-

* *The Life of William Morris.* By J. W. Mackail. New impression. (Longmans, Green & Co.)

corded that "the journey has deepened the impression of Iceland, and increased my love for it. The glorious simplicity of the terrible and the tragic but beautiful land, with its well-remembered stories of brave men, killed all querulous feeling in me, and has made all the dear faces of wife and children and love and friends dearer to me."

It was in 1873 he wrote those words, and he had already studied Icelandic literature with Mr. MAGNÚSSON, and was resolved to give English versions of the Sagas. But when he went up to Oxford twenty years before he could only imagine what the early home of the Vikings was like. Nature, however, can lead us as well by means of illusions as by realities, and young MORRIS, of the tribe of the White Horse, astonished his fellow Freshmen at Exeter by his fire and impetuosity, bodily strength, high temper and "his habit of beating his own head, dealing himself vigorous blows, to take it out of him." BURNE-JONES was entered at the same time, and "at first sight each found in the other a kindred and complemental spirit; within a week they were inseparable friends." Both were intended for the Church and for a time they were filled with an ecclesiastical enthusiasm. A set gathered round them of earnest students, who were also proof against all the common dangers of the city. MORRIS was the richest, for he possessed an income of about 900*l.* a year. As they were eager for knowledge, much was studied and talked about of which no account was taken in examinations. MORRIS and BURNE-JONES were fascinated by Mr. RUSKIN's books, and the former "chanted rather than read those weltering oceans of eloquence." In 1854 MORRIS was able to visit France, and Rouen gave him delight such as he had never known. It was about that time his friends discovered that "TOPSY was a big poet." As the men's minds developed they became more desirous of devoting themselves to some common effort. MORRIS had thoughts of devoting his fortune to the creation of a monastery. Others sought for a similar mode of co-operation. G. E. STREET, who then lived in Oxford, wished to set up an imitation of the German School in Rome, of which OVERBECK was the superior. However, when on a walking tour in France during the summer of 1855, both BURNE-JONES and MORRIS came to the conclusion that their vocation was not to be clergymen, although they could still attain their ideals of life and usefulness, one by painting, the other by architecture. What the art was to MORRIS is thus described by Mr. MACKAIL:—

> Morris did not graduate as a professional architect, nor in all his life did he ever build a house. But for him, then and always, the word architecture bore an immense, and one might say almost a transcendental, meaning. Connected at a thousand points with all the other specific arts which ministered to it out of a thousand sources, it was itself the tangible expression of all the order, the comeliness, the sweetness, nay, even the mystery and the law, which sustain man's world and make human life what it is. To him the House Beautiful represented the visible form of life itself. Not only as a craftsman and manufacturer, a worker in dyed stuffs and textiles and glass, a pattern designer and decorator, but throughout the whole range of life he was from first to last the architect, the master craftsman whose range of work was so phenomenal, and his sudden transitions from one to another form of productive energy so swift and perplexing because, himself secure in the centre, he struck outwards to any point of the circumference with equal directness, with equal precision, unperplexed by artificial subdivisions of art and untrammelled by any limiting rules of professional custom.

MORRIS's family was disappointed at the change, but there can be no doubt he showed more aptitude for architecture than for theology. On January 21, 1856, being in his twenty-second year, he signed his articles and began work in STREET's office in Beaumont Street, where PHILIP WEBB was then chief clerk. Meanwhile BURNE-JONES had become acquainted with GABRIEL ROSSETTI, and was following painting under his direction. MORRIS soon came under the artist-poet's influence, and before the end of the year he arrived at the conclusion that he was better fitted to be a painter than an architect. Accordingly he quitted STREET's office. Mrs. MORRIS, according to Mr. MACKAIL, never quite forgave BURNE-JONES for what she naturally thought was mainly his work. On MORRIS himself the dissolution had an unsettling and, for a time, almost a disastrous effect."

The two friends lived together, and as BURNE-JONES was poor, and economy must be considered, they took unfurnished rooms at 17 Red Lion Square, which had been occupied by ROSSETTI and WALTER DEVERELL. The cheap furniture of those days could not give pleasure to a young fellow like MORRIS, who had created many a palace of art and adorned the rooms with Mediæval objects. It was therefore decided that WEBB and himself should design simple furniture, which was to be truthful and pleasing although made of deal. They produced, according to ROSSETTI, tables and chairs like incubi and succubi, a round table as firm and as heavy as a rock, and a settle which made the room used as a studio one-third less in area. But, with all the defects of the pieces, the experiment was the prologue to the founding of MORRIS & Co., a firm that can never be overlooked whenever the history of industrial art in this country is composed. The decoration of furniture by painting offered a new field for the activity of the three friends.

It was in 1857 that ROSSETTI went to Oxford to see BENJAMIN WOODWARD (DEANE, SON & WOODWARD), who was engaged on the new museum which was considered to be more than a building, for to many it signified the adoption of Victorian Venetian Gothic. He was also occupied with a hall for the Union Society. ROSSETTI saw an opportunity for wall-painting, and as WOODWARD concurred, the approval of the building committee of the Union was obtained. MORRIS and BURNE-JONES, with many other young artists and amateurs, were glad to co-operate. The subjects were taken from the "Morte d'Arthur." The series might have helped to promote a more general desire for wall-painting in English buildings, but decay set in almost before a work was finished, and the fragments which have survived retain a melancholy interest. It was while engaged in Oxford that MORRIS became acquainted with the lady to whom he was married in April 1859, and whose features are immortalised by several of ROSSETTI's drawings.

We have heard lately lamentations about the incubus of wealth which is supposed to make the poor man's lot enviable to millionaires. There is much which money cannot accomplish, but when a man has ideas it can enable him to have them realised. MORRIS could write poetry without any fear of wasting the time on which his income depended, and could have the volumes published, although he was aware he would never sell enough of them to pay the printer's bills. In the same way, when he returned to England with his wife he could create a home according to his own fancy, and without any regard whether it corresponded with the houses occupied by families of position in the country. He gave the commission to PHILIP WEBB, who was in independent practice, and the site selected was an orchard near the village of Upton, in Kent. The exterior was plain, and suggested some of STREET's office work. The Lamp of Truth had illuminated the design. The drawing-room was to be made the most beautiful in England, and "everything, or nearly everything, that was to furnish or decorate it had to be designed and made." But as in the rooms in Red Lion Square there was independence of the cabinetmaker, it was resolved at Upton to follow that precedent. On the suggestion of MADOX BROWN or ROSSETTI a company was formed, and to MORRIS it appeared as a realisation under the happiest circumstances of his early notion of a community seeking to realise an ideal. MORRIS claimed that they formed "the only really artistic firm of the kind, the others being only glass-stainers, or else that curious nondescript mixture of clerical tailor and decorator." They went beyond the limits of advertising manufacturers by describing themselves as artists who were for many years attached to the study of the decorative arts, although some were novices. At first there were financial difficulties, but the novelty of the experiment, which, like Captain SHANDON's *Pall Mall Gazette*, was supposed to be carried out by gentlemen for gentlemen and by university graduates for graduates, was appreciated, and high prices were paid for simple things. In those days there was little knowledge about art in relation to industry, and when men were taken as experts they had a right to expect liberal remuneration for saving their clients from the consequences of bad taste. The firm lasted until 1875, and was not dissolved without

disagreeable consequences. The house at Upton was not neglected. But before it was completely furnished and decorated MORRIS was laid up with a severe attack of fever. The distance from London was too great to be traversed twice a day by a convalescent, and reluctantly the house had to be resigned. We are told that after he left it in the autumn of 1865, "MORRIS never set eyes on it again, confessing that the sight of it would be more than he could bear."

By residing in London he was able to devote more time to the expanding business of the firm and to gain more leisure for poetic composition. How he could accomplish so much with his own hands must always inspire wonder. MORRIS generally confined himself to work in which he could have a personal interest, and in that way the labour was lightened. But the quantity of literary and artistic production which he executed suggests a Northman's heroic energy exercised in construction instead of destruction. It is said he composed seven hundred lines of "The Earthly Paradise" in one day, and his regret on the completion of that charming collection of poems was in part at least owing to the fertility of mind he enjoyed while the verses flowed from his pen. MORRIS was one of the lucky men for whom labour was a solace. Mr. MACKAIL tells us that:—

The need of games to pass the time—the reason why nine persons out of ten after they are grown up play games at all—was a thing he never felt. His mind was always working, and his hands never long idle. Nor, in spite of his exceptional swiftness in reading and the immense detailed knowledge which he acquired from books, was he what is called a great reader. His power of rapid reading did not degenerate into the mere physical craving to read. He always knew whether he wanted to read a book or not, and when he did not nothing could induce him to read it. His library, until he began to collect early printed books, was not large, nor was it either selected or kept with any special care.

(*To be continued.*)

WINFIELD MANOR.*

THERE are few places which possess such a many-sided interest as the manor-house of South Winfield. It illustrates to what degree our forefathers often succeeded when making selection of the location of their habitations in combining the two qualities of beauty and strength; and to the lover of the picturesque its fine old ivy-mantled ruins are always a source of delight. To the student of domestic architecture it appeals as a striking example of the transition from the feudal castle to the baronial hall and mansion; whilst its association with the imprisonment of the ill-fated Mary Queen of Scots in the sixteenth, and the struggles between Parliament and the Crown in the seventeenth century, commend it to all who take an interest in the stirring historical events of their own country.

Many conjectures have been offered as to the origin of the name. In the Domesday Book the manor is referred to as both Winefeld and Winnefelt, from which a writer in the *Archæologia* deduces the theory that it was formerly a vineyard—the field of the vine—but there is no evidence to support such a supposition. Another suggestion is that Winfield is derived from the circumstance of a battle having been fought and some notable victory secured there. But as Blore, whose book on "Winfield and its Manor House" is the standard work on the subject, quaintly but sagaciously observes:—"We rarely meet with a field of victory whose honour is not tarnished by its having been also the field of defeat." A further and more likely derivation may be found in the fact that Guin in the British signifies water, and that the Guin-field, or water-field was so-called from the frequent floods from the stream which flows through the valley, and which, as Blore remarks, caused the floor of Winfield Church to be covered with a foot of water three or four times every winter. Personally, I incline to a fourth theory which attributes the origin of the name to Win or Whin, by which the common furze or gorse is often known in Derbyshire and Yorkshire. The adjoining parish is that of Brackenfield—the field of bracken; what more likely than that its neighbour should be known as Winfield—the field of gorse?

At the time of the Norman survey the manor of Winfield was held by William Peverel, a natural son of William the Conqueror, who was lord of the manor of Chesterfield. Indeed, his possessions were most extensive, for we find that he owned 39 manors and villages in Nottinghamshire, 44 in Northamptonshire, 12 distributed over the four counties of Essex, Oxford, Bedford and Buckingham and 13 in Derbyshire. From the family of Peverel the manor descended into the possession of the families of Heriz and Bellers, but in the reign of Henry VI. a dispute, which culminated in a lawsuit, arose as to the disposition of this and other property. Ralph, Lord Cromwell, claimed it as cousin and heir-at-law of Margaret, wife of Robert de Swyllington, while Sir Henry Pierpoint, representing another branch of the family, maintained that he was entitled to the property as heir-at-law of John de Heriz. This suit was not fought out to the bitter end, but a compromise was effected under which the manor of Winfield came into the possession of Lord Cromwell.

The manor-house at that time was situated near to the Peacock inn, not far from the present railway station, but on the Alfreton side of the railway. It was adjacent to the present main road from Derby to Chesterfield, and abutted on the much-discussed Rykneld Street, which connected the two Roman stations of Little Chester and Chesterfield. Cromwell commenced the erection of what must have been the very magnificent mansion of which to-day only the ruins are left to us. The date is generally ascribed to about the middle of the fifteenth century. Camden is the authority for attributing the erection to Cromwell, but his statement receives a curious corroboration in the fact that over the entrance gateway are bags or purses of stone, in allusion to the circumstance that Cromwell filled the office of Lord High Treasurer. The manor-house at Coly Weston, in Northamptonshire, underwent enlargement at the hands of Cromwell, and there again the bags or purses are found carved in the stonework. Cromwell sold the reversion of the estate to John, second Earl of Shrewsbury, by whom further additions to the buildings of the manor-house were made.

As at Haddon, these buildings are so arranged as to enclose two courts or quadrangles, though unlike Haddon, there is not independent access to each. Admission is gained on the east side through an archway into the southern court, and thence through a second gateway into the inner or northern court. The buildings between the two courts are in a good state of repair, and are in fact inhabited at the present time by the custodian of the ruins. The buildings which formed the sides of the southern court comprised the barn, the "barracks"—a name which Mr. J. D. Leader surmised was bestowed during the civil wars when Winfield was besieged—the stables, outbuildings, and quarters for the servants. On the north-west side of the manor-house the declivity of the ground was so great that little fear of successful attack from that quarter was entertained, but on the sides where the ground was more level earthworks appear to have been thrown up, and the field to-day is known by the name of "the bulwarks." The northern quadrangle contained the chief apartments of the mansion. Opposite to the entrance gateway, and on the north side of the court, is the porch which gave access to the great hall and the state apartments. "To the westward," says Mr. Leader, "stands the massive tower of the keep, with dungeon cells in its thick walls, and running from this tower along the west side of the court are the foundations of a range of buildings in which, according to tradition, were the apartments of the Queen of Scots. Nothing now remains of them but the outer wall and the inner foundations, but some idea of the character of the accommodation may still be formed. The numerous narrow windows, the fireplaces and the many angles all point to a series of small rooms; and if there were any larger rooms they must have fronted to the court, a position that made them not only safe from hostile attack, but in the case of the Queen of Scots diminished the chance of escape." The tower at the south-west angle rises to a height of 72 feet, and the prospect from its summit is both extensive and beautiful, though the landscape is not of the bold and rugged character which marks so many scenes in Derbyshire. Tradition has it that Mary's apartments and this tower were connected, and that from it she was able to see the approach of friends or their messengers and thus keep up secret communication with the outside world. The most beautiful part of the building is the south front of the banqueting-hall, a spacious apartment 72 feet 4 inches long and 36 feet 5 inches wide, with a finely decorated oriel window. The daïs was at the east end of this room, and the staples which still remain in the walls point to their having been hung with tapestry. Unfortunately the hall was spoiled in the seventeenth century by its then owners, who converted it into two storeys subdivided into dwelling-rooms. What remains of the windows on the north side must be assigned to this period. Underneath the large hall, and corresponding to it in length and breadth, is a room called the "crypt," respecting which much controversy has arisen. Mr. Leader dismisses the theory that it was a servants' hall by calling to mind the habits of the times—the lord and his attendants taking their meals together, divided only by the salt—and suggests that it may have been the chapel. Dr. Cox, on the other hand, affirms

* A paper read by Mr. W. Jacques at the meeting of the Chesterfield Students' Association.

that it had no connection with ecclesiastical purposes, that the chapel was a detached building to the north-east of the banqueting-hall, though only some traces of the foundations now remain, and that the most probable use of the crypt was that of a servants' hall. Between two such authorities it would be presumptuous to attempt to decide.

I have already said that the manor-house passed into the possession of the Shrewsbury family on the death of Lord Cromwell, and it became one of their favourite seats. George, the fourth earl, died there in 1541, but it was during the time of his namesake, the sixth earl, that Winfield first played an important part in the history of our country. Mary, Queen of Scots, was entrusted as a State prisoner to the custody of the Earl of Shrewsbury in the latter part of 1568 or early in 1569. This nobleman was the fourth husband of the famous Bess of Hardwick—a lady described as "proud, selfish, unfeeling and cruel, the oppressor of her husband, the tyrant of his family and the aggrandiser of her own." It was not a pleasant task which Shrewsbury undertook at the request of his sovereign, but Elizabeth undoubtedly displayed her customary shrewdness in making choice of him. He was a rich and powerful nobleman, and his estates were right away in the centre of England and lying wide of the great high roads of the country. He had seven mansions—the castle at Sheffield, with the manor-house in Sheffield Park; the manors of Worksop and Winfield, the abbey of Rufford, the hall at Buxton and the castle at Tutbury. The countess, by a previous marriage, had become possessed of Chatsworth, and she had also her own residence at Hardwick. Mary, after her arrest, was first taken to the castle at Tutbury, breaking the journey for one night at Chesterfield—or rather at Walton, at the house of Mr. Godfrey Foljambe. After a few weeks' residence at Tutbury, however, the earl obtained authority to remove her to Winfield Manor, and on March 20, 1569, she arrived there. She had not been here long before Leonard Dacre, a relative of the Earl of Shrewsbury, devised a plot for her escape, but was persuaded to abandon it by the Duke of Norfolk, who had hopes of marrying the queen, and who feared that if she got abroad the prospect of such an alliance would be very remote. An attack of illness—which gave rise to rumours of her death—occurred early in May, and led, on her recovery, to her removal in a letter to Chatsworth. It is not within the scope of this paper to trace the whole period of Mary's imprisonment. She remained in the custody of the Earl of Shrewsbury at various places, including Tutbury, Chatsworth, Sheffield, Worksop and Buxton until 1584.

It cannot be said that this period was a very happy one for his lordship. Lodge, in his "Illustrations of British History," sums up the character of his wife in the following terms:—"She was a woman of masculine understanding and conduct, proud, furious, selfish and unfeeling. She was a builder, a buyer and seller of estates, a money lender, a farmer, a merchant of lead, coal and timber. When disengaged from these employments she intrigued alternately with Elizabeth and Mary, always to the prejudice and terror of her husband." It is believed that the quarrels which ensued formed one of the reasons for eventually removing Mary from Shrewsbury's guardianship. Elizabeth took the wife's part, and the Earl, writing to a friend, speaks of the "hard sentence" against him, "to my perpetual infamy and dishonour, to be ruled and overanne by my wife, so bad and wicked a woman." The Bishop of Lichfield tried to effect a reconciliation, though his manner of setting about it was decidedly original. It might be correct, he said, that the Countess was a sharp and bitter shrew, but the good bishop went on philosophically to observe:—"If shrewdnesse or sharpnesse may be a just cause of sep'a'con betweene a man and his weife, I thinke fewe men in Englande would keepe their wives longe; for it is a com'on jeste, yet trewe in some sence, that there is but one shrewe in all the worlde, and ev'y man hath her; and so ev'y man might be rid of his wiefe that wold be rydd of a shrewe." At length, in 1584, the Earl obtained a long-sought permission to visit London, and Sir Ralph Sadler was appointed to take charge of Mary, who was then at Sheffield. Sadler expected that she was to remain there, but orders were given to Shrewsbury to see her settled at Winfield under Sadler's care before coming up to London. These orders were a surprise to Sadler, who, on learning of them on his arrival at Sheffield, wrote for further instructions, remarking that "comparing the openness of the country about Winfield and the greatness of the house, and therefore the more danger, to the straightness of this [Sheffield] and so the stronger, I would rather choose to keep this Queen here with 60 men than there with 300." It was nevertheless eventually agreed to remove her to Winfield, and she arrived there again in September 1584. Some idea of the responsibilities and expense incurred by Shrewsbury as Mary's gaoler may be gathered from a report made to Queen Elizabeth by Sadler. It is dated from Winfield, November 5, 1584, and is in the form of answers to a series of questions. From these it appears that there were at Winfield at that time 120 servants, gentlemen, yeomen and officers of Lord Shrewsbury's, besides fifty of Sir Ralph Sadler's, and forty soldiers, making in all the rather formidable total of 210. It was necessary, he said, that whether at Tutbury or Winfield, there should be forty or fifty soldiers in addition to the servants. The Queen of Scots had four good coach-horses of her own, and her gentlemen had six, the four being kept at Lord Shrewsbury's charge. The Queen had in attendance upon her forty-seven persons, who are thus enumerated:—"Five gentlemen, fourteen servitors, three cooks, four boys, three gentlemen's men, six gentlewomen, two wives, ten wenches and children." About twenty rooms were occupied by the Queen and her retinue. None of the furniture was her own—"she hath no stuff of her own, neither hangings, bedding, plate, napery, kitchen vessel, nor anything else," and of certain "stuff" which Queen Elizabeth had sent for her use it is said there was "nothing of it serviceable, but it was worn and spent." A question as to the Queen of Scots' ordinary diet both on fish and flesh days elicits the information that she had "about sixteen dishes at both courses—sometimes more or less." Her two secretaries, master of the household, the physician and De Prean had a mess of seven or eight dishes, and always dined before the Queen, their own servants having their "reversion." The rest of the folk dined with the "reversion" of the Queen's meat. Her gentlewomen and the two wives and other maids and children, being sixteen, had two messes of meat of nine dishes at both courses for the better sort, and five dishes for the meaner sort. As to the price of provisions, we learn from the same document that wheat was about 20*s.* and malt about 16*s.* per quarter; a good ox cost 4*l.*, a score "muttons" 7*l.*, hay was about 13*s.* 4*d.* per "lode," oats 8*s.* per quarter, and peas about 12*s.* It was during Mary's stay at Winfield that the seeds of the Babington conspiracy were sown. Most authorities overlook the fact that young Babington was a ward of the Earl of Shrewsbury. Writing in 1571 he informs Lord Burghley that Babington of Dethick is dead after a long sickness, adding "he was my neighbour at Winfield, holding for me his chief house, Dethick, by knight's service," and asking for the wardship of the young heir. The request was granted, and it was no doubt while he was a member of Lord Shrewsbury's household that Babington's romantic attachment to the Queen of Scots was first formed, with such disastrous results in after years to both. Mary left Winfield for the last time in January 1585, and her execution for her alleged complicity in the Babington conspiracy took place at Fotheringhay two years later.

Winfield Manor remained in possession of the Shrewsbury family until 1516, but on the decease of Gilbert the seventh earl in that year it was divided between the respective husbands of his three daughters—William, Earl of Pembroke, Henry Grey, Earl of Kent, and Thomas Howard, Earl of Arundel and Surrey. On the outbreak of the Civil War the manor-house was held by Earl Pembroke, who was found on the Parliamentary side. Sir John Gell had raised in October 1642 about 200 men in Chesterfield by beat of drum, and with this small force, which he succeeded in adding to in various places, he gave a good account of himself throughout the county. He met Sir Thomas Fairfax at Nottingham, and on his solicitation went to Winfield Manor in order to communicate with some Derbyshire gentlemen, one of whom was Mr. Milward, who had been a "Captayne of a trayned band," to persuade him to take up arms for the Parliament; but he was too late, for Mr. Milward had just previously accepted a commission of the king for a regiment of foot. Sir Thomas soon afterwards marched to Derby and desired to Colonel Gell that he would let him have 400 or 500 "musquetiers" to march with him towards Chesterfield and thence to Yorkshire. He was unable to spare that number, but Colonel Gell told him that he had 100 men at Winfield Manor, of whom he might have sixty, about a similar number from Captain Taylor's Company at Wingerworth, and forty of Captain Stafford's company at Chatsworth. With these it is said he was "well pleased" and marched as far as Chesterfield, where an "allaram" reached him that the Earl of Newcastle's forces were marching towards Derbyshire. He at once retreated into Leicestershire, to the apparent disgust of Sir John Gell, who declared his ability to cope with the Earl of Newcastle, and who endeavoured unsuccessfully again to join hands with Fairfax. Meanwhile the Earl of Newcastle's forces had commenced an assault upon Winfield Manor on December 7, 1643, and after four days they took it by storm; but Colonel Gell, by a rapid movement of his forces, was on the spot ten days afterwards, and in one day took prisoners two troops of horse, with their colours, in Winfield town, though he did not at that time seek to regain possession of the manor-house. The Earl of Newcastle soon departed with the main body of his troops, leaving a garrison to hold the manor-house. This garrison seems to have acted on the offensive as well as the defensive, for the following year Colonel Gell sent to Nottingham to Governor Hutchinson and Colonel Thornough for their assistance to beleaguer Winfield because it was, he said, as great an annoyance to Nottinghamshire as to Derbyshire. The place was in

due time environed, but about a fortnight later part of the besieging force had to be sent away to disperse several small bodies of Royalist troops who were assembling at Burton from Lichfield, Tutbury and other places with the intention of relieving Winfield. Major Sanders, who had charge of the detachment, had the good fortune to surprise Colonel Eyre and his regiment in Boylestone Church, capturing the whole of them without the loss of a single man on either side. Leaving a guard of dragoons over the prisoners in the church, Sanders pressed forward to Burton, where his mission of breaking up the Royalist bands was completed, and he then returned with his men to the "leaguer" at Winfield Manor again. The operations occupied some months. The besiegers managed to cut off the supply of water, hoping that this would soon bring the besieged to terms, but the latter got over the difficulty by sinking a deep well in the courtyard whence they obtained an excellent supply. In cannon, the besieged were better off than those outside, and at length "Colonell Gell finding that his ordinance would doe noe goode against the Mannor, and understanding that Major-Generall Craford had foure great peeces, sent two of his officers unto him to desire him to send them for three or four dayes for battering; and in soe doinge hee would doe the countrey good service, because it was a place that could not bee otherwise taken without they were pined out." We are told that Major-General Crawford, "desirous to doe the State and countrey good service, came presently with his ordinance and some horse and ffoott thither." The bombardment commenced on the east side from Pentrich Common, and a battery raised for the defence of the manor was soon carried, but it was found impracticable to make a breach in the walls. The cannon were then taken to a wood on the west side, where they were brought to bear with such effect that after a "three houres battrey," the garrison, numbering about 220, yielded. Pilkington, in his "History of Derbyshire," writes:—"I saw the breach by which the assailants entered, and several of the cannon-balls which were employed on this memorable occasion—one, which was lately found in the hills, weighs 32 lbs. Colonel Dalby, who was the governor of the place, was killed by a deserter who knew him as he was walking disguised as a common soldier in the stable. The hole through which he introduced his musket is still to be se n near the porter's lodge." In 1646 an order was issued by Parliament for the dismantling of Winfield Manor, and Colonel Roper, described as "a person of great worth and well known in Derbyshire," was deputed to execute the order. The destruction, however, appears to have been only partial, for twenty years later a part of the manor-house was the residence of Immanuel Halton, a famous mathematician. In later years the estate was divided, and in 1744 a member of the Halton family, to whom the manor-house had been allotted, barbarously used the ruins as a quarry for stone to erect the house at the bottom of the hill. Dr. Cox says that he has in his possession some original drawings made in 1785 which show that, notwithstanding all the vicissitudes through which the place had passed, the windows of the principal rooms remained glazed even at that date. I have carefully refrained from attempting to discuss several interesting but controversial points, which, though not strictly within the scope of the paper, offer tempting themes for remark—such as Elizabeth's treatment of Mary, and the extent to which Mary had knowledge of the Babington conspiracy—and have limited myself to setting forth the historical associations of the manor-house, and I trust that what has been said may awaken an interest in the fine old ruins which we hope to inspect for ourselves shortly.

A MUSEUM OF CARTHAGINIAN ANTIQUITIES.

THE British consul at Tunis, Sir Harry Johnston, in his report to the Foreign Office on the progress in the regency of Tunis, states that an admirable museum of Carthaginian and Roman antiquities has been formed, a collection of which is being yearly added to by the careful excavations which are being made under the direction of Père Delattre on the site of Carthage. M. Gauckler has, as the headquarters of his collections, the handsome Museum el Alaoui, established in the old Beylical Palace of the Bardo, five miles from Tunis. At the Alaoui Museum, Roman remains and Arab art are equally well illustrated. Among the more important works in 1897-98 undertaken by the Government department which is under M. Gauckler's direction, may be mentioned the gradual revelation and repair of the Roman baths at Tabarka, the discovery or repair of the aqueducts of the Sukra, the cisterns of Teburba and of Mehdia, and of the Roman fountain at Thala. On the heights of the Odéon two Roman villas of relatively late date have been discovered and cleared. They contain mosaics in layers which represent in their series the gradual progress of the art, and therefore supply most interesting information as to the gradual development of mosaic work. Another Punic cemetery has been discovered near Borj-Jedid, while at Duaf-esh-Shar, near Goletta, a most interesting mosaic 7 metres square has been brought to light. It represents a Roman mansion with various hunting scenes, and a temple of Apollo and Diana. To the south-east of Zaghwan an interesting Christian church has been discovered, containing a baptistery in the form of a cross, entirely paved with mosaics. One of the aisles had been closed at some time or other by means of an immense stone coffin-lid from a Pagan sarcophagus. This is ornamented with bas-reliefs of the Three Graces surrounded by the Four Seasons. This object has been removed to the Alaoui Museum, where also have been placed some very beautiful and perfect statues recently discovered by M. Gauckler near Carthage, and some large mosaics of the greatest interest, one of them illustrating the land of Egypt, with crocodiles, hippopotami and apes.

As regards Arab art, the mosaics of Kairwan are being judiciously preserved from decay, and hidden beauties have been revealed by the removal of innumerable layers of whitewash. The Alaoui Museum at the Bardo has just come into possession of a real treasure—a beautiful little house in the very best style of Saracenic art and architecture, which, all unknown to the authorities, actually existed alongside the Bardo Museum, only separated by a thick wall. The Bardo, of course, even in its decay is an extraordinary pile of buildings, at one time a little town of continuous inhabitations. Not only did the Beys of Tunis and many of their children and their children's dependents live here, but widows of former Beys continued to reside in nooks and crannies. One such widow of a long-deceased bey inhabited an exquisite little dwelling alongside the Bardo Museum, entered from the outside, however, by one mysterious door only. A black eunuch was often seen going in and out of this door, but as it was known that the apartments to which he went contained some female member of the Beylical family no inquiries were made. A few months ago, however, the old lady in question died. After a time her heirs decided, for some reason best known to themselves, to destroy the house in which she had lived. Accordingly Arab workmen were sent to break a way in through the outer wall. These operations and the peep of an exquisite interior which was afforded attracted the attention of the director of the museum, who forthwith made an appeal to the enlightened spirit of the Bey of Tunis. His Highness at once took measures to stop the destruction, and finally managed to transfer the possession of this Arab dwelling to the director of the museum. The damage done was soon repaired. On the other hand, the simple piercing of the wall connected with the Museum of El Alaoui this beautiful Arab house, to which it will remain attached as a specimen of the best style of Saracenic domestic architecture and decoration. It is intended that the house shall be left entirely intact, with Arab cooking implements, Arab furniture, beds and the like, just as though it was about to be occupied, so that visitors to Tunis may realise the appearance of an Arab house of the best description before the spread of European ideas had spoilt local taste.

TESSERÆ.

Sir James Thornhill.

HIGH as was Thornhill's reputation, he was far from being generously rewarded for some of his works, and for others he found it difficult to obtain the stipulated prices. His demands were contested at Greenwich, and though La Fosse received 2,000*l.* for his work at Montagu House, and was allowed 500*l.* for his diet besides, Sir James could obtain but 40*s.* a yard square for the cupola of St. Paul's, and no more for Greenwich. When the affairs of the South Sea Company were made up, Thornhill, who had painted their staircase and a little hall by order of their cashier, demanded 1,500*l.*; but the directors learning that he had been paid but 25*s.* a yard for the hall at Blenheim, they would allow no more. He had a longer contest with Styles, who had agreed to give him 3,500*l.* for his work at More Park; but not being satisfied with the execution, a lawsuit was commenced, and Dahl, Richardson and others were appointed to inspect the work. They appeared in court, bearing testimony to the merit of the performance. Styles was condemned to pay the money, and by their arbitration 500*l.* more for decorations about the house and for Thornhill's acting as surveyor of the building. This suit occasioning inquiries into matters of the like nature, it appeared that 300*l.* a year had been allowed to the surveyor of Blenheim, besides travelling charges, 200*l.* a year to others, and that Gibbs received but 550*l.* for building St. Martin's Church. By the favour of that general Mecænas, the Earl of Halifax, Sir James was allowed to copy the cartoons at Hampton Court, which occupied him for three years. He executed a smaller set of one-fourth the dimensions. Having been very accurate in noticing the defects and the additions by Cooke, who repaired them, and in examining the parts turned in to fit them to the places, and having made copious studies of the heads, hands

and feet, he intended to publish an exact account of the whole for the use of students, but this work never appeared. In 1724 he opened an academy for drawing at his house in Covent Garden, and had before proposed to Lord Halifax to obtain the foundation of a royal academy at the upper end of the Mews, with apartments for the professors, which, by an estimate he had made, would have cost but 3,139*l.*; for Sir James dabbled in architecture, and stirred up much envy in that profession by announcing a design of taking it up, as he had before by thinking of applying himself to painting portraits.

The Oecus.

The word oecus signifies a room of extraordinary size, though it very frequently means an entrance hall or dining-room. Vitruvius mentions four kinds of them in such a way as to vary them into five species; he mentions the Tetrastylon, two Corinthian ones, and adds to these also the Cyzicene and Egyptian. Oecus Tetrastylos is a room where four insulated columns support an upper storey. It will be convenient to have the entrance of this construction, for the floor of the hall will thus be made more secure, and by the advantage of the columns the height of the entrance may be made to agree with the proportion of the other parts. The Corinthian oecus is a room which, according to Vitruvius, has single columns placed either on a poggio or base, or on the ground; that is, columns in a single row and inserted in the wall, either standing upon pedestals, as in the first figure, or standing on the ground, as in the second, and for the sake of distinction it is called Corinthian; each style is excellently adapted to a hall. The entablature may be made either of wainscot or stucco. The ceiling should be either semicircular or curvature, depressed to the third part of the breadth of the room. The most beautiful length will be that which exceeds the breadth by two-thirds. The Cyzicene oecus was not of Italian but of Grecian origin, nor does it differ so much from the Corinthian in figure and use as in the situation, the doors and the windows. It looks towards the north and into the gardens, and so capacious are its dimensions that it would contain two triclinia placed opposite each other with their respective circuits. It has folding doors in the middle, and windows made to open like doors to command a view of the gardens. The Egyptian oecus, far exceeding the others in beauty, contains the height of two storeys, so that it has two orders or rows of columns. The lower ones are insulated, with an architrave only placed upon them, according to Vitruvius, but to which Palladio properly adds a frieze and a cornice. On the corona of this rests an entire wall, in which is inserted a second order of columns, which are either half or three-quarter ones. They are placed directly over the insulated columns, and are a fourth part less, and in their intercolumniations are windows. In the part below the wall stands off from the columns, but is connected by means of the storey above; so that round the sides of the hall a walk is formed by the columns, covered with a floor open to the air, and with a balustrade.

Fashions in Art.

The influence of fashion, in producing so frequent revolutions in the sentiments of men with regard to the beauty of those objects to which it extends, and in disposing us to neglect or to despise at one time the objects which we considered as beautiful before, may perhaps be explained upon the principle of association. Fashion may be considered in general as the custom of the great. It is the dress, the furniture, the language, the manners of the great world which constitute what is called the fashion in each of these articles, and which the rest of mankind are in such haste to adopt, after their example. Whatever the real beauty or propriety of these articles may be, it is not in this light that we consider them. They are the signs of that elegance and taste and splendour which is so liberally attributed to elevated rank; they are associated with the consequence which such situations bestow, and they establish a kind of external distinction between this envied station and those humble and mortifying conditions of life to which no man is willing to belong. It is in the light, therefore, of this connection only that we are disposed to consider them; and they accordingly affect us with the same emotion of delight which we receive from the consideration of taste or elegance in more permanent instances. As soon, however, as this association is destroyed, as soon as the caprice or inconstancy of the great have introduced other usages in their place, our opinion of their beauty is immediately destroyed. The quality which was formerly so pleasing or so interesting in them, the quality which alone we considered, is now appropriated to other objects, and our admiration readily transfers itself to those newer forms which have risen into distinction from the same cause. The forsaken fashion, whatever may be its real or intrinsic beauty, falls, for the present at least, into neglect or contempt, because either our admiration of it was founded only upon that quality which it has lost, or because it has now descended to the inferior ranks and is of consequence associated with ideas of meanness and vulgarity. A few years bring round again the same fashion. The same association attends it, and our admiration is renewed as before. It is on the same account that they who are most liable to the seduction of fashion are people on whose minds the slighter associations have a strong effect. A plain man is incapable of such associations, a man of sense is above them, but the young and the frivolous, whose principles of taste are either unformed or whose minds are unable to maintain any settled opinions, are apt to lose sight of every other quality in such objects but their relation to the practice of the great, and of course to suffer their sentiments of beauty to vary with the caprice of this practice. It is the same cause which attaches the old to the fashions of their youth. They are associated with the memory of their better days, with a thousand recollections of happiness and gaiety and heartfelt pleasures which they experience now no more. The fashions of modern times have no such pleasing associations to them. They are connected to them only with ideas of thoughtless gaiety or childish caprice. It is the fashions of their youth alone, therefore, that they consider as beautiful.

Roman Coloured Inks.

It is probable that there were many ways of colouring ink, in changing different colours, employed by the Romans. Red ink (made of minium, vermilion) was used for writing the titles and beginnings of books, so also was ink made of rubrica, "red ochre," and because the headings of laws were written with rubrica, the word rubric came to be used for the civil law. So album, a white or whited table, on which the praetors' edicts were written, was used in a similar way. A person devoting himself to album and rubrica was a person devoting himself to the law. There was also a very expensive red-coloured ink with which the emperor used to write his signature, but which any one else was by an edict forbidden to use, excepting the sons or near relations of the emperor, to whom the privilege was expressly granted. But if the emperor was under age, his guardian used a green ink for writing his signature. On the banners of Crassus there were purple letters. On pillars and monuments letters of gold and silver, or letters covered with gilt and silver, were sometimes used. In writing also this was done at a later period. Suetonius says that of the poems which Nero recited at Rome one part was written in gold (or gilt) letters (aureis litteris) and consecrated to Jupiter Capitolinus. This kind of illuminated writing was more practised afterwards in religious compositions, which were considered as worthy to be written in letters of gold (as we say even now), and therefore were actually written so.

Nature and the Ideal.

Nature is a collective idea, and though its essence exist in each individual of the species, can never in its perfection inhabit a single object; our ideas are the offspring of our senses; without a previous knowledge of many central forms, though we may copy, we can no more imitate, or, in other words, rise to the principle of action and penetrate the character of our model, than we can hope to create the form of a being we have not seen without retrospect to one we have. Meanness of manner is the infallible consequence that results from the exclusive recourse to one model; why else are those who have most closely adhered to, and most devoutly studied the model, exactly the most incorrect, the most remote from the real human form? Can there be anything more disgusting to an eye accustomed to harmony of frame than the starveling forms of Albert Dürer, unless it be the swampy excrescences of Rembrandt? the figures of the former, proportions without symmetry; those of the Dutch artist, uniform abstracts of lumpy or meagre deformity; and yet the German was a scientific man, had measured, in his opinion had reduced to principles the human frame; whilst the Dutchman, form only excepted, possessed every power that constitutes genius in art, seldom excelled in invention and composition, and the creator of that magic combination of colour with chiaroscuro, never perhaps before and surely never since attained. And did not the greatest master of colour but one, Tintoretto, if we believe his biographer Ridolfi, declare that "to design from natural bodies, or what is the same, from the model, was the task of men experienced in art, inasmuch as those bodies were generally destitute of grace and a good form?" We are informed by the Latin editor of Albert Dürer's book on the "Symmetry of the Human Body," that during his stay at Venice he was requested by Andrea Mantegna, who had conceived a high opinion of his execution and certainty of hand, to pay him a visit at Mantua, for the express purpose of giving him an idea of that form of which he himself had had a glimpse from the contemplation of the antique. Andrea was then ill, and expired before Albert could profit by his instructions. This disappointment, says the author of the anecdote, Albert never ceased to lament during his life. How fit the Mantuan was to instruct the German is not the question here; the fact proves that Albert felt a want which he found his model could not supply, and had too just an idea of the importance of his art to be proud of dexterity of finger or facility of execution, when exerted only to transcribe or perpetuate defects

NOTES AND COMMENTS.

IN these days, when old and young believe they are competent to judge buildings, statues and pictures, it is refreshing to meet with an eminent man of letters and a scholar to boot who is not ashamed to own his incapacity to instruct working artists. Last week Sir WALTER BESANT appeared as a lecturer at the Manchester Art Museum. Those present who expected to have at least an exposition of the mathematics of æsthetics or of the principles adopted in designing the Temple of Jerusalem, were disappointed, for the lecturer confined himself to some ancient and modern artists whose work, as HEINE says of MOSES, was not in brick and granite, but who tried to form human pyramids, human obelisks, and out of the residuum to raise a people. As to himself Sir WALTER BESANT said :—"I have always felt that it is an impertinence, to say the least, for a man who does not possess some practical knowledge of art, if only enough to understand its difficulties and to appreciate its limitations, to put himself forward as an art critic. For my own part, I have never attended an art school; I have never even made a serious study of art; I believe that I could perhaps distinguish between an early Flemish master and an early Italian; in an examination on the history of art I should come out as badly as most. As for the characteristics of the great painters, ancient or modern, I am like the man in DU MAURIER'S picture. 'Before a BOTTICELLI,' he said, 'I am dumb.' In fact, I am obliged to be dumb because I have nothing to say." In spite of this self-depreciation we suppose there are no readers of Sir WALTER BESANT'S books who would be anxious about the result if he were to announce the publication of what is called an "art novel," or let us say one in which most of the characters would be followers of one or other of the arts.

THE mystery in which the poverty of REMBRANDT has been enveloped is likely to be dispelled if Dr. A. BREDIUS, the director of the Mauritshuis, continues to be fortunate in discovering records like those he has imparted to the *Oud-Holland*. It appears that in 1654, when he was in litigation with the representatives of his late wife, REMBRANDT received from DIEGO D'ANDRADO, a Portuguese Jew, an advance of 75 florins on account of a portrait of a young girl. The work was completed, but DIEGO declared it did not resemble the original, and through his notary, ADRIEN LOCK, demanded that the work should be altered or the money returned. REMBRANDT declined to do either, and threatened proceedings against the Portuguese for libel. He demanded payment of the balance, and said he was willing to submit the portrait to the judgment of a jury of members of the Painters' Guild of St. Luke. Otherwise he would sell the portrait by public auction. The result is not known, but it is evident from the incident that REMBRANDT was losing his popularity as a portraitist. The second revelation discovered by Dr. BREDIUS relates to an action for breach of promise which was taken against the painter by GEERTJE DIRCX, who was the nurse of his son TITUS. She declared he not only promised, but gave her an engagement ring. REMBRANDT confessed his intimacy with the plaintiff, but denied the promise to wed. The Court, however, decided against him, and he was ordered to pay 160 florins down and 200 florins yearly to GEERTJE. As REMBRANDT'S prices were much reduced the drain on his resources was unendurable. It would be interesting to know what the other maid-servant, HENDRICKJE SLOFFELS, thought of the affair. The two cases indicate that REMBRANDT was as weak a man as his later portraits suggest.

THE extent of the business in illustrated post-cards which is transacted abroad can hardly be realised in England. One firm in Dresden has published 20,000 views in that form, including many of the most interesting subjects in Europe. Some publishers confine themselves to architecture and street scenes, while others give reproductions of famous pictures in continental galleries. In fact, a variety of subjects can be obtained, from portraits to armorial shields. Already collections of photographic post-cards have with some supplanted those of postal stamps, and they are found to be more interesting. Exhibitions of them are occasionally held. The curators of galleries and historic buildings which are open to the public in many places aid in promoting the sale of the views. There is a novelty in sending a communication from a feudal castle like Pierrefonds which many are glad to seize. The preparation of the cards offers a new field of industry to others besides photographers, and there is no doubt they will lead to an increase of interest in buildings, pictures and statues. There is also the advantage of accuracy, and a comparison of the old-fashioned views on note-paper with the modern photographs, however small may be the scale, will exemplify one of the differences between science and art.

THE French people are so fond of public acknowledgments whenever they render the least services to the State, it is no wonder few gifts are rendered to the musées and other galleries. What is the return for a valuable picture or statue? There is an official acknowledgment of whatever is given, but a man cannot go about with the document around his hat, and the public therefore cannot admire his generosity. The Municipal Council of Paris has at last realised how little inducement there is to make the citizens become donors to the public collections. It has been, therefore, resolved that for the future every one who offers an important gift which will be worthy of acceptance is to receive a medal bearing an effigy of the Republic with an inscription recording the gratitude of the city. As in appearance it will correspond with the medals to which the town councillors are entitled, a man can be taken to be one of the civic fathers without undergoing the trouble of an election. By the new arrangement it is anticipated the Musée Carnavalet and the Bibliothèque Historique will be enriched without any increase of the rates.

ILLUSTRATIONS.

CATHEDRAL SERIES.—ROCHESTER: NAVE, LOOKING WEST.—DOORWAY IN SOUTH CHOIR TRANSEPT LEADING TO CHAPTER-HOUSE.—DETAILS OF WEST DOORWAY.

THE west doorway of Rochester Cathedral must have been considered when first seen as a marvel. There is a wonderful contrast between its sculptured richness and the severity of the interior. HENRY I., who is introduced as if he were one of the pillars of the Church, had granted several privileges to St. Andrew's Priory, and we suppose it was considered a duty to represent him. He holds in his right hand a sceptre, and in his left a book, for it is well to remember he was known as Beauclerk, or Scholar. But he was hard on the Church, and for a time devoted the revenues of Norwich, Ely, Canterbury, Durham and Hereford to his own use. He also exacted large sums from the prelates and abbots. He seized on all the treasures left by GILBERT, Bishop of London, for the benefit of the Crown. It suggests the terrible state of oppression at the time when we find the following in the Saxon Chronicle :—"How unjustly this miserable people is dealt with. First they are deprived of their property, and then they are put to death. If a man possesses anything it is taken from him; if he has nothing he is left to perish by famine." Queen MATILDA, who is seen on the other side, was originally called EDITHA, and was the daughter of MALCOLM III. of Scotland. She was a popular queen, and was known as Molde, or the Good. She was a patroness of minstrels and poets, and munificent beyond her means. The lintel above the figures is supposed to represent the Apostles, and in the tympan is a figure of CHRIST supported by angels and surrounded by the evangelistic symbols. The other doorway is flanked by figures typical of the church and the synagogue. The latter was not supposed to be a pleasing figure, but it will generally be found that the sculptors availed themselves of the opportunity to represent a beautiful woman, and we suppose the figure at Rochester was no exception. Over them are figures of doctors and angels, and a canopied figure which it is impossible to identify forms the apex. The door itself is modern.

QUEEN'S HOTEL, LEICESTER SQUARE.—GRILL ROOM.

SUMMER HOLIDAYS AMONG FRENCH CATHEDRALS.

By the Author of "Ecclesiologia Germanica," &c.

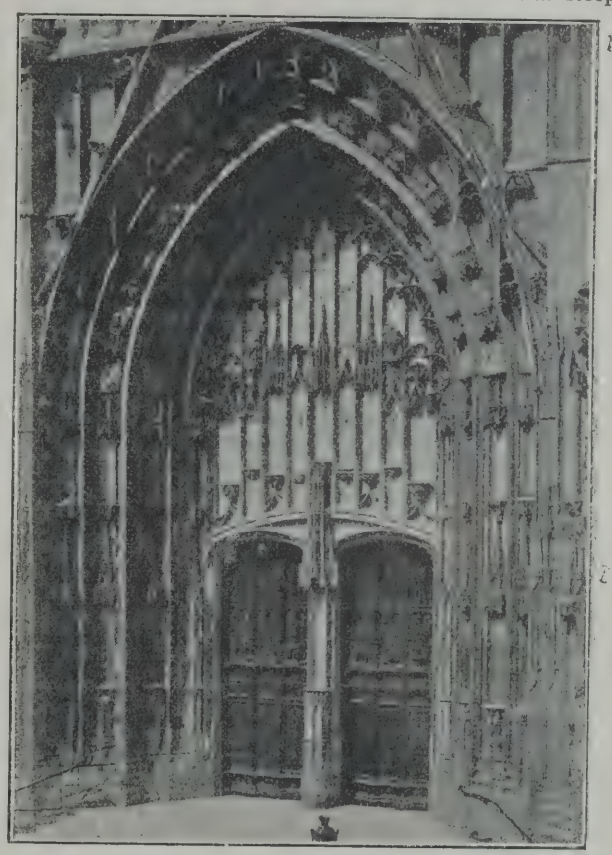
(*Continued from page* 371.)

XXIII.

Beauvais.

AFTER a *café au lait* in the Place on the following morning I repaired to the cathedral with the intention of "assisting" t the Offices du Matin—Terce, Canons' Mass and Sext—but to ny great regret learnt that, from pecuniary reasons, their recita- ion had been discontinued. I have never had the good fortune o hear an accompanied service in Beauvais cathedral; its effect nust, I conceive, be very fine.

The money spent some five-and-twenty years ago upon the rection of an astronomical clock would, properly invested, have one far towards the sustentation of the daily choral offices in his sublime Gothic choir, which one tries hard to think is not a building where an artist has striven after more than he can possibly attain. It is, perhaps, presumption to criticise such work as this, yet it is impossible to pursue architectural study with that blind faith which drives one to indiscriminate admira- ion of everything done by twelfth and thirteenth-century builders.



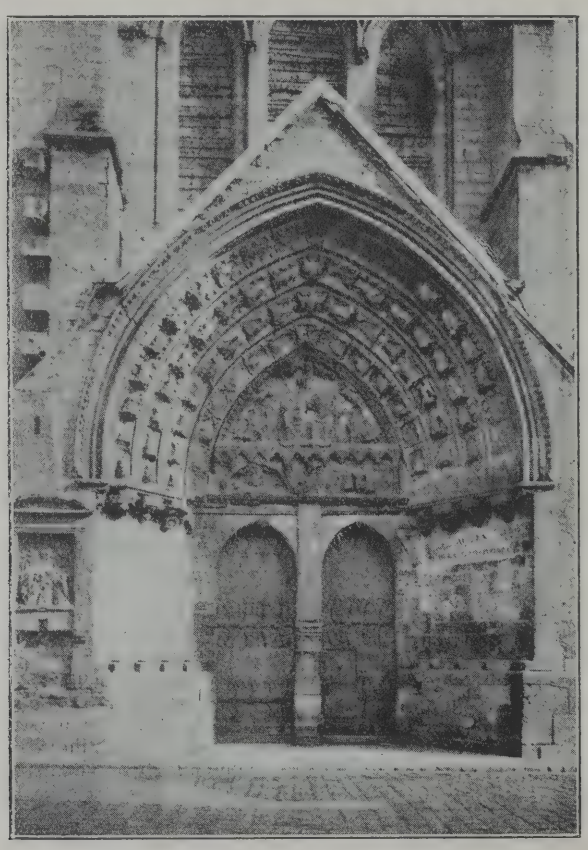
Beauvais Cathedral: from the South-east.

A glance at the apsidal chapels convinces us that Beauvais athedral was originally planned on a scale by no means aggerated; but when the desire for emulating the neighbour- g cathedral of Amiens became too strong to be resisted, a iforium and clerestory were raised on the arches opening to ese chapels in order that the vault of the circumambient aisle ight reach the increased height of the great choir arcades on which was reared a clerestory reaching the unprecedented eight of 157 feet.* Commenced in 1225 and consecrated in 1272, Beauvais choir fell twelve years afterwards—punishment brought on by that "vaulted ambition which overleapeth itself."

Looked at in this light, one is not surprised, especially on examining the arches of the choir, to find a building so unworthy of its age—the palmiest one of French architecture. Here the main object of the architect seems the attainment of height and airiness at the expense of everything else, many of the details being coarse and even slovenly in execution. In order to remedy its defects after the fall, the three arches on either side of the choir were subdivided into six, and from the great size of the piers and the narrow span of the arches, the present effect of the interior of this choir, terribly sublime at a first glance, is one in which the arches have little to do, and in which much beauty has been sacrificed in order to keep the vault from falling in again. In the portion of unrelieved wall between the tops of the six arches and the triforium string-course, traces of the three original ones are plainly distinguish- able.

The best work in the cathedral is, as may be guessed from its date, in the apsidal chapels and the eastern aisle of either transept, which is good thirteenth century. The upper portions of the transepts were not begun until the com- mencement of the sixteenth century,* and one bay of the nave had been projected when, on the completion of the transepts, whose works had dragged on for more than fifty years, it was abandoned for the erection of a central steeple

Beauvais Cathedral: South Portal.



which should rival in altitude that of the dome of St. Peter's. Finished in 1568, this steeple, in consequence of being built before the nave was there to receive its lateral pressure, lasted but five years. "Le jour de l'Ascension de l'Année 1573, tandis que le clergé et le peuple étaient en procession dans les rues de la cité, elle s'écroula avec un fracas épouvantable: un épais

* The following notes on the chronology of this remarkable edifice, om Pierre Louvet's "Nomenclatura et Chronologia Rerum Ecclesi- ticarum Diœcesis Beluacensis," 1613, may be quoted:—"*Milo de antholio Episc.* 1225. Bruslement du chœur de S. Pierre de auuais. *Guilelmus de Gressio Episc.* 1247-69. Il fist paracheuer le œur de S. Pierre. *Reginaldus de Nantolio Episc.* 1272. Les anoines commencent de faire le diuin service au nouueau chœur de ur Eglise Cathédrale. *Theobaldus de Nantholio Episc.* 1284. rande ruine ès voultes et pilliers du chœur de S. Pierre de Beauuvais, de manière que les chanoines y cessèrent le diuuin seruice par le temps de *quarante ans.*" It is not a little curious that Europe's two most stupendous choirs, *i.e.* those of Beauvais and Cologne, should have been completed almost simultaneously, *i.e.* in 1322. During the rebuilding of Beauvais choir the services were held in the Basse Œuvre, of which rude Romanesque building a portion still remains west of the unfinished nave.

* The prelate under whom this gigantic work was begun was Louis de Villers de l'Isle Adam, and Louvet in his "Chronologia" records the "Commencement de la Croisée de l'Eglise Cathédrale de Sainct Pierre de Beauuais, 1500." These transeptal façades at Beauvais certainly rank very high indeed among works of their age and class, works in which the hand that achieved the transept of Sens may be traced.

nuage de poussière couvrit toute la ville. Dès la veille, de tristes indices avaient annoncé le malheur qui devait bientôt arriver : quelques pierres isolées s'étaient détachées du sommet ; l'équilibre était rompu ; rien ne pouvait arrêter la catastrophe. Le Maître Maçon était monté à l'intérieur de la tour, pour examiner l'état de la muraille ; il s'aperçut promptement de l'imminence du danger. Il cria au peuple assemblé dans l'église qu'il eût à se retirer très-promptement. Il n'était pas encore descendu, que l'affreuse chute ébranla toute l'église et répandit la consternation dans les esprits. On se hâta de réparer les dommages occasionnés par ce terrible accident ; mais qui eût osé penser à reconstruire cette aiguille prodigieuse? On se contenta d'élever à la place un modeste campanile en bois." (Bourassé, "Cathédrales de France.")

The vault of the south transept, which had suffered most from the fall of this steeple, was restored, and the date of its completion, 1593, can be read upon one of the keystones. The works in the nave were resumed, but the treasury was so completely exhausted that they were abandoned. Perhaps this was not altogether to be regretted when the declension of Gothic art at the commencement of the seventeenth century is remembered. However, its completion might have formed a not uninteresting epoch in the history of French architecture, besides enhancing our appreciation of that choir which, in spite of its faults, can only be viewed for the first time with bated breath.

BEAUVAIS : WEST DOOR OF ST. ETIENNE.

Although vastly inferior to some of her Northern sisters in richness and extent of coeval vitreous decoration, Beauvais Cathedral presents the student with a specimen of each of the three great phases through which the art of glass staining passed.

Of the Mosaic style the early thirteenth-century windows of the lady chapel are very good examples. In the clerestory of the choir we have an exemplification of that system which prevailed so extensively in the fourteenth century, of arranging the subjects or figures with a band of rich colour about the middle of a long succession of windows, so as to produce a decided horizontal line of rich colour throughout the building, harmonising with and assisting the lines of the architecture. In the present instance this arrangement of a band of canopied figures with white glass above and below * is not only productive of a good effect in windows at such great height, but gives an idea of strength to the fenestration, which would otherwise have had an attenuated look.

Of stained-glass produced just previous to its fall, that in the great transeptal roses at Beauvais is very fine and rich in colouration.

Among the curios brought together in a museum hard by the cathedral, I regarded with melancholy interest a fair embroidered mitre. It belonged to F. de la Rochefoucauld, Bishop of Beauvais at the time of the Revolution, and who, with his brother the Bishop of Saintes, the venerable Dulau, Archbishop of Arles, and nearly 200 ecclesiastics of every grade, so bravely "met the tyrant's brandished steel" in the awful massacre that took place in the convent of the Carmelites at Paris on the night of September 2, 1792.

(*To be continued.*)

* For a long time after the Gothic Revival artists in stained-glass perpetuated the fatal mistake of overloading their windows with positive colour. A glaring instance of this is the great south transeptal rose at Westminster, the work of Ward and Nixon in 1847-48. Among pioneers of the Revival, Mr. Butterfield paid great attention to stained-glass, and, wherever he could, superintended the execution of windows to be placed in churches of his own design, much in the same way as Pugin did. To this fact, and to his insistence upon white or neutral glass for backgrounds to his figures, the east window of the south aisle at All Saints, Margaret Street, by O'Connor, owes so much of its excellence ; also those at the east end of St. Augustine's College Chapel, Canterbury, and St. Matthias, Stoke Newington, by Willement and Wailes respectively. Within the last twenty years a liberal use of white glass has, I am glad to say, grown into favour with the majority of our leading practitioners in the vitreous art, and those wishing to judge for themselves of the sparkling effect produced by a bold employment of grisaille balanced by strongly-expressed colours in vigorous contrast will be gratified by an inspection of such works as the eastern quintuplet of lancets in St. Margaret's, Lee, S.E., the east window of SS. Peter and Paul, Teddington (superintended by the late G. E. Street, R.A.), and those in the clerestory of St. Mary Abbott's, Kensington, all the work of Messrs. Clayton & Bell ; by that in the northern chapel of All Hallows, Southwark, by Messrs. Burlison & Grylls ; and by that with which Mr. J. Ninian Comper has graced the very Early Middle Pointed east window of the College chapel at Brackley, one of the most successful modern windows of the style with which I am acquainted. Much of the recent German glass in this fourteenth-century style is excellent. I refer more particularly to those in the northern range of chapels in Mayence Cathedral ; to the eastern windows in the Minster, at Essen, and to those in St. Lambert's, at Münster—all of which, from their attenuation, are peculiarly fitted for the treatment adopted in the clerestory at Beauvais.

THE REVIVAL OF TRADESMEN'S SIGNS.*

WHEN at the request of our chairman I undertook to read a paper on "Signs" I hoped that not much research would be necessary. I soon, however, became aware that to do justice to it would be almost like writing a history of England. I only now begin to understand why our chairman selected it, and that I was perhaps somewhat rash in agreeing to undertake the preparation of such a paper. But that books on the subject have already been written by Larwood and Hotten, Philip Norman and Hilton Price, I could hardly have dealt with signs at all this evening. To become really a pundit on this difficult and abstruse subject some knowledge of heraldry, astrology, mythology, theology, archæology, zoology, history, biography and geography is needed. I scarcely possess more than a limited acquaintance with many of these branches of knowledge.

The necessity for displaying some sort of sign if one wishes to barter goods, accommodation or service against money or kind, can hardly be disputed. In a new settlement the first care of the intending storekeeper is to scrawl his name and trade on a piece of wood and hang it out to attract the passers-by. In America this is called "setting up one's shingle." The necessities of the budding communities of to-day were no less felt in the past. In days when customers could not read a representation of the commodity on sale would be more serviceable than an inscription. If opposition stores were competing more telling representations of the same objects, more attractively rendered, would serve to distinguish one establishment from the other.

Such signs must have been in use from remote times. It is only when the wares themselves can be displayed to the passers-by in safety that signs can be dispensed with, as in open bazaars and markets. In the East time-honoured customs of trade and hospitality rendered signs unnecessary, and there is no mention of them in either the Bible, Josephus, or the "Arabian Nights." Neither has anything indicating their use been met with in the excavated cities of Asia and Africa. It

* A paper read before the Applied Art Section of the Society of Arts by Mr. J. Starkie Gardner, on May 30.

seems, in fact, that signs were an institution almost peculiar to Europe, for it is only within its limits that records of them appear—doubtfully in ancient Greece, but with certainty in Rome. The most venerable is that of the Bush, denoting the tavern in Italy, which reached Roman Britain. Our ancient proverb, "Good wine needs no bush," commemorates this most venerable of signs, the symbol of the house in which jovial companions foregathered. The Cock and the Chequers are also Roman signs, which no doubt equally found their way here, and link our civilisation with that mighty Empire to which we are perhaps apt to underrate our indebtedness.

In the earliest times, when people in England were mostly illiterate, only very easily understood signs could be used, clearly denoting the nature of the establishment and the trades carried on. In days when people and things actually were what they seemed to be, and there were no shams, embattled walls really symbolised the power of the noble, and banner-shaped vanes and finials proclaimed his degree. The church, the monastery, the mill, the smithy, the shambles, the malt-house were all easily recognised; the tavern or ale-house almost alone required some distinguishing sign. We consequently find that the earliest ordinances made it compulsory for these to display the Bush—the ivy bush—sacred to Bacchus; whilst other traders might display signs or not as they pleased. In the towns where more recondite trades were carried on, their kind was advertised by such articles as a woolpack, tailors' shears, barber's pole, oil-jar, or magnified boot or glove.

All signs of this nature are common or collective—that is, used in common by all engaged in the same trade. They are scarcely mentioned by old writers, but are seen in the earliest illustrations, something very like a "wine bush" appearing in the Bayeux tapestry. Among well-known examples of collective signs are the three golden balls of the goldsmiths, the three gold crowns of the drapers, the vintners' three tuns or bunch of grapes, the wheatsheaf of the brewers and bakers, the compasses of the masons and carpenters, and so on. Interesting as this branch of the subject might prove, it is not my intention to pursue it farther to-night.

Signs, distinguishing and peculiar to individual establishments, are the product of a later and more sophisticated stage of civilisation. They, perhaps, only came into use on the definite adoption of distinguishing badges by the nobility. The noble in residence in a city would, in feudal days, entertain his vassals and neighbours coming from his own part of the country; and, in his absence, hospitality would be dispensed by his seneschal or major-domo. Doubtless, as the feudal feeling relaxed, and guests became more casual and numerous, some payment might be looked for, if not by the nobleman, by his stewards. Similarly, in hospices and monasteries entertainment could be had, but payment from the well-to-do would be expected, as it is in continental hospices at the present day. In very remote parts, where travellers are rare, one is warmly welcomed, and no payment accepted; in more frequented routes, however, payment, though nominally optional, is expected; whilst along the regularly beaten tracks bills are made out and presented in the usual way. Under the latter circumstances, the business of entertaining well-to-do travellers becomes a source of considerable profit, and the nobleman's steward, equally with the rich merchant, would fix up some sign indicative of a readiness to receive paying guests. The citizen would distinguish his house by some fanciful device, like the trade-marks of to-day; or by a rebus, such as that handed down as the Bolt-in-Tun. We learn that the nobleman displayed a painting of his arms on his town house, a custom surviving to this day in the painted hatchment. No less a person than the poet Chaucer, summoned as a witness in the Scrope and Grosvenor dispute, as to the right to the Bend-or, deposed that in walking up Friday Street he saw a sign with these arms painted on, put there by a knight of Chester whom he had not previously heard of. Amateur Bonifaces were distinguished from professional "herbergists," and their houses only resorted to by people of substance. Such establishments were, beyond doubt, the origin of the bona-fide hostelry or hotel.

Individual signs, unlike the collective signs, are referred to by nearly all our older writers, such as Chaucer, Froissart, Shakespeare, Ben Jonson, Beaumont and Fletcher, and some of them are inwoven into our national history. Some still existing signs vie with and even surpass our oldest families in their venerable antiquity, dating back to the Plantagenets. The more ancient, if existing, would present a pictorial history of our manners, customs, sports and pastimes for 500 years past, and more or less correct representations of all our popular heroes. Walpole, writing a century and a half ago, remarked:—

"I was yesterday out of town, and the very signs as I passed through the villages made me make very quaint reflections on the mortality of fame and popularity. I observed how the Duke of Cumberland's Head had succeeded almost universally to Admiral Vernon's, as his had left but few traces of the Duke of Ormond's. I pondered these things in my head, and said unto myself, 'Surely all glory is but as a sign.'" *

The custom of not merely two, but hosts of a trade agreeing to cluster together, as in Goldsmiths' Row, Leather Lane, Ironmonger Lane, Budge Row, rendered it difficult to find enough appropriate and specifically distinguishing names to provide for each establishment, a difficulty such as is encountered in christening our numerous men-of-war to-day. For such multitudes of distinctive signs the realms of history (natural, sacred, profane and fabulous), of husbandry, travel, humour, of gastronomy and astronomy, the ménage, religion, sport and profanity, were ransacked. Everything upon, above or beneath the earth was pressed into the service, from the Virgin Mary to His Satanic Majesty; from our sovereign lord the King to Dirty Dick; the Moon and the Cheshire Cheese. The Cockatrice, Phœnix, Salamander, Griffin—fearful wildfowl these—and the more popular of the patron saints, figured largely on the signboard; nor were the ever-welcome devotees of the Leather Bottel and Pewter Tankard unremembered.

Of such signs as the Sun, Star, Crescent, Dolphin, Flying Horse, Fortune, Elephant, Bear, Lion, Cock, Wheatsheaf, Ivy and Vine, and Chequers, it is impossible to guess the antiquity. Some belong to pagan times. The Adam and Eve, Salutation, Angel, Virgin, Baptist's Head, Crosses and Cross Keys, Mitre, Nuns and Friars, must be Christian; signs like Neptune, Atlas, Hercules, Golden Fleece, smack of more freethinking times; while the Mother Redcap, Mother Shipton, Dick Whittington, Robin Hood, Guy of Warwick, the Black Prince, and the John of Gaunt, Falstaff and Palsgrave speak for themselves.

Some of the many Kings' and Queens' Heads and Crowns may date back to Mediæval times. The landlord of a Crown Inn was executed by Edward IV. for venturing upon the mild joke that he had made his son heir to the crown. The Tabard and the Bell in Southwark are mentioned by Chaucer in 1383, and the White Hart, hard by, was Jack Cade's headquarters, and has been immortalised by many pens, from that of Shakespeare to Charles Dickens. This, with the Antelope, Dragons, Red, White and Black Lions, White and Blue Boars, Swan, Hawthorn, Feathers and Rising Sun, were Plantagenet badges, and extremely popular while the dynasty lasted. Henry V. was entertained at a Red Lion on his return from Agincourt in 1415. The White Hart in Bishopsgate bore till quite recently the date 1480 on its front. The Boar's Head in Eastcheap is mentioned in the time of Richard II., and was once London's principal tavern. It was in this house that Prince Hal and his two brothers made such a riot that they merited the attention of the Mediæval chucker-out, and were taken before the magistrate. The Duke of Somerset, prophetically told to beware of castles, was killed by Richard Plantagenet in a Castle tavern. The Chequers on the Hoop was visited by Chaucer's "Canterbury Pilgrims," and a Chequers tavern stood in Lambeth in 1464.

The Tudor badges naturally supplied a fresh set of popular signs, of which the Rose was the favourite. Our saying "Under the rose," has not, however, an English origin. Perhaps some present have sat under the huge rose in the pleasant vaults of Bremen, where the town councillors were wont to meet to quench their thirst with draughts of Rhenish. The Bull and Mouth and Bull and Gate are believed to commemorate an event in the reign of Henry VIII.—the taking of Boulogne. Bulls and Bears became extremely popular signs under Elizabeth, when baiting these animals was the favourite national amusement.

There must have been a great massacre of Popish signs upon the demise of Queen Mary, such as Cross Keys, Maidens, and Catherine Wheels. The Three Nuns in Aldgate, mentioned by Ben Jonson, and the Pope's Head in Cornhill, which existed in 1464, and the Mitre in Cheape, extant in 1475, are notable survivals which still continue to flourish. These, like the Three Cranes in the Vintry, and the Mermaid Tavern in Bread Street, were once household words. It was in the latter that Raleigh established a literary club frequented by Shakespeare and the wits of the day. The only known letter to Shakespeare is dated from the Bull Tavern in Carter Lane. Of equal celebrity were the Rainbow and the Devil in Fleet Street, and Hell and Heaven, in Westminster, alluded to in Butler's "Hudibras." The Society of Antiquaries was incubated in the Young Devil Tavern in Fleet Street, though the august society in whose rooms we are assembled was evolved in the cooler atmosphere of a coffee-house hard by. Of the religious signs spared on the death of Mary, comparatively few survived the more drastic disestablishment under the Protector, Cromwell. An Act of Parliament even extinguished the Golden Cross in the Strand, as savouring of superstition.

Of the signs introduced by such events as the Stuart Accession, the Commonwealth and the Restoration, it would detain you too long to speak. Neither can we run through the catalogue of the hosts of admirals, generals, littérateurs and poets

* Walpole to Conway, April 16, 1747.

commemorated during the centuries of struggle through which we have attained to our present state of wealth and prosperity. Long may it be ere the Vernons, Drakes, Benbows, Rodneys, Nelsons, Keppels, Granbys and Marlboroughs disappear from our sign-boards, and the nation ceases to drink to their memories and think of their deeds. The innumerable whimsical, fantastic or far-fetched signs must also be passed over. The sporting signs of the Horn, the Greyhound, the Gun, the Nag's Head, Old Fox, the Coach and Horses, Spotted Dog, Horseshoe, Fox and Hounds, Hare and Hounds and Dog and Duck are dear to many, and speak of the tastes of our ancestors even more than of our own. When destined to disappear before the march of progress, some may at least remain of those perpetuated in the names of streets and squares, as Half Moon Street, Hart Street, Red Lion Street and Square and Falcon Square.

Under Richard II. it had been made compulsory on innkeepers to hang out signs, though other trades might do as they pleased. Within twenty years of his death, the great projection of the "ale stores," as tavern signs were then called, impeded the highway, especially in Cheape, and injured the stability of the houses, and an Act was passed to limit them to not more than 7 feet in length. Repressive and permissive measures seem to have alternated ever since. Sometimes the streets were graced with innumerable signs, hung out as banners are on gala days, their numbers defeating the object in view by obscuring each other. The efforts to outvie one's neighbours caused the signs, at times, to become so serious a nuisance that legislation had to be resorted to. Charles I. granted to the citizens of London on his accession, as a special boon, the right "to hang out signs and posts for the better finding out of their dwellings, shops, arts or occupations, without impediments, molestation, or interruption of his heirs or successors." His son, Charles II., however, took advantage of the Great Fire to abolish this privilege, and compelled all signs to be fixed to the face of the house. This fashion of fixing painted signs to house fronts, instead of hanging them out, has been maintained on the death of armigerous occupiers up to the present day. The carved stone and cast-iron signs let into the fronts of houses chiefly date from the edict of Charles II. Soon afterwards the hanging signs were again numerous, the difficulty of providing names introducing a dual nomenclature, when such combinations as the Cock and Bull, Cat and Fiddle, Goose and Gridiron became the fashion. The necessity for signs relaxed when the streets were numbered. This commenced in 1708, it appears, with Prescott Street, Goodman's Fields, for Hatton writes, "Instead of signs the houses here are distinguished by numbers, as the staircases of the Inns of Court or Chancery." Until then it was absolutely necessary to identify houses unprovided with signs or some distinguishing feature as in the vicinity of some other house adequately distinguished by some sign, as "over against" the Load of Hay or Yorkshire Grey. Omnibuses, like their forerunners the stage coaches, still as far as possible choose public-house signs to mark their destinations and stopping-places. The coffee-houses in the seventeenth century, entirely new and smart institutions, struck the greatest blow at the use of signs. Wishing it to be understood that they were not to be classed with the older tavern, they broke away from old customs and inaugurated the new mode of merely writing up the name of the owner, as Dick's, Tom's, Wills', Sam's, Buttons', Peales', or more high-sounding names as the Smyrna or Cyprus. The last repressive Act was passed in 1762 for taking down all overhanging signs under a penalty of 5*l.* and 20*s.* per day, and this was so effectual that scarcely any remained by 1770, except a few over the bookstalls in Holywell Street, which are noticed by our much-respected secretary, Mr. Wheatley, in his book on London as existing down to 1849.

The Mediæval form of projecting sign, as pictured by Larwood and Hotten in their excellent book, was a carving in wood fixed within a hoop. The hoop was a very venerable and ancient affair, handed down from Pagan times. The ivy garland in honour of Bacchus, the so-called "bush," and the universal tavern emblem, required a backbone, and this backbone remained after the ivy had been stripped from it. Some ancient illustrations show that the tavern "Bush" became elaborated into a series of intersecting hoops, garlanded over and surmounted by a crown of evergreens, perhaps additionally decorated with ribbons on gala days. From simple and pure to rich and fantastic is the order of progress in matters decorative, with set-backs when revulsion of feeling sets in. The Jacks-in-the Greens, nearly the last and now almost extinct survival of the old May-day revels, but which were quite common in my younger days, were merely tavern signs perambulating the streets—Jacks-in-the-Alehouse, but the alehouse turned loose into the streets, attended by a motley crew of revellers. Sayings such as "As wise as an owl in an ivy bush" show that the words "tavern" and "bush" were synonymous. When the mere "bush" no longer sufficed the bare hoops were utilised to hold some badge distinguishing the house, specifically distinguishing badges being held to be *de rigueur*, garlanded and beribboned, it may be, on festival days. A George-in-the-Hoop is recorded as a tavern sign of the reign of Edward III., and others as Cocks or Hens "in-the-Hoop" are mentioned in the time of Henry VI., and to these doubtless the singular phrase "Cock-a-Hoop" is to be traced.

Belonging to a much later period is the more sophisticated fashion of hanging out actual pictures illustrative or descriptive of the name of the house. These were set in richly worked frames, and often depended from very handsomely carved or worked brackets on supports. There are vague traditions that pictures by such world-renowned masters as Holbein, Correggio and Paul Potter have suffered the indignity of having been thus hung out to attract the passer-by. It is absolutely certain that paintings by celebrated English academicians, such as Hogarth, Wilson, Harlow, Morland, Old Crome, David Cox and others, have served this purpose. Some distinguished academicians, as Cipriani, Charles Cotton, Samuel Wall and John Baker, really commenced their careers as sign-painters; and, if we may draw conclusions from the price of 500*l.* paid for a picture of Shakespeare for a sign in Little Russell Street, Drury Lane, the profession was perhaps not a bad stepping-stone to more enduring honours—especially as those called in to paint the sign sometimes stayed to paint the apartment as well. The paintings of a room in the Pope's Head, Cornhill, deserved the encomiums of the genial and observant Pepys, and those of the Rose, near Temple Bar, of the more critical Walpole. The great mart for the average pot-boiler sign kept in stock was Harp Alley, Shoe Lane, while a more *recherché* class could be commissioned from the coach-painter. In 1762 an exhibition was held by a self-styled Society of Sign Painters, to which Hogarth, who fully entered into the joke, was a contributor.

When picture signs were so popular and at times magnificent, the supports and frames which surrounded and suspended them were worthy of them. These were of carved wood or iron, or of both combined, gilded and painted, and sometimes so preposterously massive as to pull out the front of the house they adorned. A particularly ill-contrived construction caused a front to fall out in St. Bride's Lane in 1718, killing, with others, the king's jeweller and two ladies. A sign of the Three Queens in Clerkenwell, on the other hand, was so firmly built in that when ordered to be removed in 1764 it cost 200*l.* to take down. Among the many large and elaborate constructions London could boast of, those pre-eminent and reputed to be the largest were the signs of the Castle in Fleet Street and of the White Hart in Southwark. A Frenchman, by name Misson, visiting England in 1719, says that though signs were kept small in Paris by restraining influences from above, in London they jutted out so far as to touch each other, and to stretch right across the narrower streets to the opposite wall. Many, he remarks, with their painted and gilt iron supports, must have cost over 100 guineas. Another Frenchman travelling in England in 1765, saw nothing to chronicle on landing at Dover except the enormous size of the public-house signs and the ridiculous magnificence of the ornaments with which they were overcharged. Every sign formed a triumphal arch which crossed the streets. A picture of a particularly elaborate sign, that of the White Hart at Scole, in Norfolk, which cost, in 1655, 1,057*l.*, represents an immense arch with carved panels of deities and heraldry, crossing from the house and resting on a brick pier on the opposite side of the road.

As a practical worker in iron, it may naturally be expected that I should show more partiality for the iron brackets which supported the signs than for any other part of the structure. This is in truth the case. When and where iron was first used for the purpose I do not know, and therefore shall not pretend to say, but probably the use dates well back into the Middle Ages. Illustrations of iron sign brackets occur in the design books of the seventeenth and eighteenth centuries. That such a renowned architect and designer as Jacques Androuet du Cerceau should have thought it worth while to devote a page of illustrations in his celebrated treatise on architecture to them, proves that so far back as the sixteenth century iron sign brackets were esteemed as vehicles for artistic treatment. The designs are in the taste of the day, simple and slightly inclining to the geometric, charmingly evolved by a refined ornamentalist, but not by a practical iron-worker. Next in point of date is the leaf from the treatise of a practical mechanic —Mathurin Jousse The design is crude and not particularly well drawn. The third illustration, from the illustrated catalogue of a real worker and designer in iron, presents a far better, though extremely simple design. It must be remembered that the French in the second half of the seventeenth century, far from encouraging extensive signs in their streets, restricted them by law to very modest dimensions. Probably for this reason none of the great designers in France, who published such sumptuously-illustrated books on iron-work, have cared to give any illustrations of sign brackets. It was otherwise in England, however, at this time, as we have seen, for magnificence in the matter of signs was the order of the day. Nothing more elaborate

can well be imagined than the three designs for sign brackets comprised in Tijou's book, published towards the close of the seventeenth century. Tijou, it is known to most of you, was the designer and contractor for the iron-work at Hampton Court Palace, St. Paul's Cathedral, Chatsworth and other places. Any smith present will, however, at once perceive that these designs could never have actually been carried out or even drawn by a practical man. They go far to prove, I may incidentally remark, that Tijou was not himself a craftsman or expert, but merely a designer, whose designs, moreover, required a very great deal of alteration at the hands of experts before they could have been handed out for execution by the smith. The old tradition that Huntingdon Shaw, of Nottingham, really executed the work may not be far wrong. This by the way. Unfortunately, illustrations of English sign brackets previous to the enactment of 1765, which condemned them to destruction, are extremely rare. Though Hogarth incidentally depicts a great many signs, only one is at all an elaborate piece of iron-work.

Of actually existing iron sign brackets there are none in England, speaking according to my limited knowledge, older than the Chippendale or Adam's periods—few, indeed, being more than a century old. To find older examples we must pass over to the Continent. The most ancient that I have met with is the remarkable bracket in the Marché du Vendredi of Bruges, from which still depends the model of a curry-comb. Judging from the contemporary font-cranes, which it greatly resembles in its details, it must date from about 1500. There are a few others in the Low Countries, preserved in museums, of almost equally early date—all, both sign and bracket, being solely of iron. In Germany a few of late Renaissance date may still exist, but as in Belgium, the vast majority are of the style of Louis XV., known as the Rococo. None appear to have been designed for hanging pictures, but only to include signs made of beaten iron or copper. Those designed to receive a huge representation of a key, the sign of the locksmith in Germany, are the most elaborate, serving to illustrate practically the skill of the craftsman seeking custom as well as to decorate his abode. In France few sign brackets seem to have survived the Revolution, and in Italy and Spain there are practically none. Illustrations of two of the richest examples I have met with in England, designed locally, and of a third in the Nottingham Museum, showing a real blacksmith's ideal of what a sign should be, must conclude my series of ancient examples.

It may be debateable whether hanging signs should be permitted in our London streets or not. If well designed and not too numerous, they add a certain picturesqueness, especially in certain situations. So long as they cause no practical inconvenience or danger to the public it would seem superrogatory to prevent money being spent in the decoration of our not over beautiful thoroughfares, and to abrogate a privilege and custom that has, on and off, existed for several centuries. The omnipotent London County Council not having as yet definitely decreed that no more signs shall be erected in London, I am enabled to add a few modern examples to my series of pictures both of other people's and my own productions. The place of honour in this series must, I think, be accorded to the sign at the bottom of St. James's Street, designed by Mr. De Wilde, once, I am pleased to think, on my own staff. It hangs high, but is very effective and well-proportioned, and not inharmonious with the Norman Shaw building on which it is placed. An additional merit is that it is a pioneer, having been the first important sign put up in London during her present Majesty's reign.

Another very striking sign is to be seen at Heath's, the hatter, in Oxford Street, made by Messrs. Strode, from I believe the architect's design. Its merit is slightly lessened in my eyes, at all events, from the fact that it appears to some extent to have been inspired by the example just seen. Of signs made for public-houses, those for the Rising Sun in Tottenham Court Road and the Shades in Charing Cross are by my own firm, to the order of Messrs. Treadwell & Martin. Being my own offspring the less said about them the better. The most original and daring sign yet erected is undoubtedly that for the same architects, by my friend Mr. Shirley. It is quite alone and very quaint. The only fear I have about it is that if many signs with so great a projection were erected in our streets, the privilege of putting up any at all might soon be abrogated.

At a Meeting of the Imperial Fire Insurance Company held at their chief office, 1 Old Broad Street, E.C., on the 8th inst., the report of the directors for the year ending December 31 last showed premiums received 612,544*l.*, and losses 384,983*l.* A dividend was declared for the year of 1*l.* 5*s.* per 10*l.* share, absorbing 75,000*l.*, after the payment of which the funds of the company stood at 1,257,374*l.*, exclusive of the paid-up capital of 300,000*l.*

PICTURE FRAMES IN ANTIQUITY.

IN the course of the discussion on Mr. Hunter Donaldson's paper on "Picture Frames" at the Society of Arts, Sir George Birdwood, K.C.I.E., C.S.I., said:—The question of picture, as of sculpture,* frames is indeed one of all but the very highest artistic importance, and painters and sculptors, truly reverent toward their art, ought to be more particular as to the framing, or other setting, of their divine handiwork, than even a writer about the binding and "forwarding" of his book. He had always taken the deepest interest in picture frames, and not only in relation to the pictures they enshrined—for the frame of a great picture should be regarded as its shrine (Latin, "scrinium") or ark, and should be designed in this devout regard—but also in relation to the position the enshrined picture has to permanently occupy; but he had never once given a thought to the historical genesis of the picture frame, until his attention had been drawn to the subject by the spontaneous and felicitous statement of his views and opinions on the artistic question of picture frames with which Mr. Hunter Donaldson had favoured and delighted them that evening. Of course the ultimate origin of picture frames is in the instinct—one of beauty as well as of utility—natural to finite reason, to define, that is, to fix bounds to, to frame-in, everything, even the infinite. Thus according to the Hecatæan geography, which is the geography of Homer and Hesiod, the whole habitable earth, the sun-rise lands [Asia, with Libya], and the sun-set lands [Europa: *cf.* Erebus, Hesperus, Hesperides] is framed-in by the circumfluent stream of outer ocean, and in the Ptolemaic astronomy, which is the astronomy of all poetry and romance, the Seven Heavens of our planetary system are bound in by the Twelve circumambient Wardens of the Zodiac. Even the infinite comprehension and charity of the "Fides Catholica" has, from the sixth or seventh centuries of human salvation, been picturesquely defined by the peremptory terms of the circumscriptive creed of, as is said, "the holy prelate Athanasius." In the Græco-Roman wall-painting of the first century A.D., formerly to be seen in the Casa d'Adonide at Pompeii, a pigmy is represented before an easel painting a picture, and it is clear that he is painting-in the frame as he paints the picture. This is what was done in the case of many of the wall-paintings of Pompeii, and what was, and is, done with many of the paintings in the Coptic churches of Egypt, and it is universally done by the native artists of India. The oldest actual example† of an approximately determinable date of this simple manner of framing-in a picture known to me is the archaic Corinthian terra-cotta plaque in the Louvre, representing, in black figure-painting, a potter at his wheel, before a heap of clay, turning the wheel with his left hand, and moulding a lump of the clay into a vase with his right, two finished vases hanging above him, the whole framed in with a heavy border of black. This is the proper framing for trivial pictures. In the Græco-Roman painting of the first century A.D., from the Casa del Ceruscio, Pompeii, now in the Naples museum, representing a female artist painting a Herm, a Cupid stands before her holding up a sketch of the statuette, stretched on a frame, which is obviously the original of the bald and arid so-called "Oxford frame." This is the identical "pictura in linteo"—"painting on canvas"—illustrated in Rich's "Dictionary of Roman and Greek Antiquities," and Dr. Murray would appear to have shown Mr. Hunter Donaldson, in the British Museum, an actual frame of this description. It was evidently derived from the embroidering frame and the weaving frame of the ancient Egyptians, Greeks, and Romans; for, at least among the Greeks, pictures were painted with the embroiderers' needle long before they were painted with liquid colour and the brush. The only painted picture known to Homer is the "pictura textilis"—"acu picta." The frame of the classical lyre suggests an elegant modification of this otherwise wholly mechanical, unimaginative and frigid form of frame.

---

* Frame is rather an awkward term to apply to a thing used merely to bind in, or enclose, any other thing, for in its primary sense it means the essential, and total fabric, body, structure, or form (as apart from the "materia prima") of things—as in these quotations:—"This goodly *frame*, the Earth;" "And spangled heavens, a shining *frame*;" "And whatever stirs this mortal *frame*." But every one now knows what is meant by the word frame as used in its secondary sense, in connection with pictures, and it is of happy augury in this connection that its ultimate meaning, in its Anglo-Saxon form of *fram*, is "excellent," "surpassing." In fact, frame is allied to the Latin *primus*, "first," and the Sanskrit *parama*, "most excellent."

† On the ceilings of the temple of Amen-Ra, at Thebes, dating from the fourteenth century B.C., we repeatedly find representations of the vulture, the symbol of Maut, the consort of Amen, floating, on wide extended wings, in a clear, blue sky, bounded on either side and on top by a border of darker blue, studded with stars. But this three-sided border is probably a severely conventionalised form of Nuit, the goddess of the overstretching Midnight Sky, and was evidently in no way intended as a true painted-in frame for these lacunarial tableaux, although it affords a beautiful suggestion of one.

The earliest decorative frame known to me is Egyptian of the fourteenth century B.C., and it at once expresses in the most emphatic terms of art the subtle, sympathetic relations that must always subsist between a frame and the contents for which it is especially designed. In this case the frame and its contents are a specimen of massive jewellery, slightly more than 5 inches broad at the base, slightly less than 5 inches broad at the top, and just 4¼ inches high. It is the sepulchral pectoral, now in the Boulak Museum, of Kha-em-nas, son of Rameses II., and it is wrought in lapis-lazuli and gold. What at once gives this splendid jewel its imposing dignity is that its frame is fashioned in the form of the naos, cella, or "holy of holies" of an Egyptian temple; or, as he would himself rather suggest, of the shrine within the "holy of holies." We have another suggestion, of an analogous character, for artistic frames in the terra-cotta amulets of the first or second century B.C., stamped with figures of the Ephesian Artemis and the mystic inscriptions known as "Ephesia grammata." One of these was found at Syracuse, and is to be seen in the museum there. The frame in this case is modelled after the actual ædicula (literally "little edifice"), canopy, tabernacle, shrine, or, in secular language, cabinet of the Goddess in the cella of the temple of the "Great Goddess of the Ephesians," as that was modelled after the Greek frontispiece of the temple itself, with its pediment crowned with palmetted antifixes and supported by pillars. In the sepulchral portrait of an Archigallus, or high priest, of Cybele, of the third or fourth century B.C., now in the Capitoline Museum, at Rome, the frame is a plain moulding; from the high priest's neck hangs an amulet of the ædicula type already described; and the sculpture is further interesting from the sort of shallow niche in which the head and shoulders of the figure are countersunk taking the form of the Buddhistic niche, which, in my belief, first suggested to the Greek artists, enslaved by the Arabian conquerors of Syria, the characteristic Saracenic arch. In the small portable shrines of Cybele, of the third and fourth centuries B.C., found in hundreds throughout Asia Minor, and frequently in Greece, we have examples of admirable frames for memorial sculptures; the treatment of the plinth in these shrines especially satisfying the feeling for a strong support for the contained bust or statuette. The ædicula dedicated to Terra Mater found in the Campo Verano, near Rome, and now in the Palazzo del Conservatori, at Rome, is, in the artistic force of its severely simple construction, the noblest example extant of this type of sacrosanct statuary. The representation of the ædicula of the Tauric Artemis on a wall-painting at Herculaneum, shows it to have been an arched canopy of the simplest open construction, resembling a garden wire-work arch, surmounted by a sort of archaic "fleur-de-lis," or semi-"thunder-bolt." It would seem to have suggested the decoration of Lord Beaconsfield's statue on last Primrose Day, when the graceful canopy of arched palm branches was somewhat unhappily surmounted by a feebly-modelled coronet of primroses. In short, the ædicula in its endless permutations affords fruitful inspirations, not only for picture frames, but also for statue frames, whether tabernacular or mural shrines, or more familiar niches. So also does the cippus, or tombstone [*cf.* the Greek "stele," both going back to the phallic pillar, of which the most interesting Roman example was the urban Lar, the Deus Rediculus, also called Tutanus, who had his temple near the Porta Capena] of the Imperial Roman period; as may be judged from the cippi of the first century A.D., of Marius, Petilius and Pintæus, found at Bonn, and now in the Bonn Museum. In the case of the cippus of Marius, in the corners left between the arch of the niche in which the deceased is represented on horseback, and the square head of the stone, are sculptured representations of the "dona militaria" (torques, &c.) conferred on him in life. This is a most happy way of relegating the honorific insignia of great men, which happen to be artistically unassimilable in their portraits, to the decoration of the picture frames. The cippus, of the first century A.D., of another eques, found in Rhenish Hesse, now in the museum of Mayence, and that of Q. Sertorius, found at Verona, and now in the Museo Lapidario there, and of Q. Statius, found at Athens, and now in the museum there, are examples of the simple and effective setting of memorial sculptures. On a cippus in the museum at Avignon only the insignia of office—the fasces and the curule chair—of the municipal magistrate commemorated are sculptured below his name. In a Romano-Gallic cippus in the Caen Museum, the tradesman commemorated is represented with a steelyard in his right hand, and the goods he is about to weigh in his left. In the Romano-Gallic cippus in the Sens Museum a blacksmith is represented standing in a niche (modelled from the arched doorway of a Christian church) beside his anvil, with a hammer in his right hand and his fire-tongs hanging to the left of him. Another Romano-Gallic cippus of the Christian period presents the bust of an innkeeper in a niche (similarly arched to the last), pouring wine from a flagon in his left hand into a tumbler in his right. There are many such Romano-Gallic cippi, and all are invaluable, not only as graphic illustrations of the arts and crafts and trades of the period, but more especially in the present connection of the principles which should determine the artistic treatment, of which the enframing is an integral part, of such subjects. There is a variety of the mural cippus, or it might equally well be said ædicula, called, I do not altogether understand why, armarium. This term is found first applied to a chest for arms, tools, tackle, &c., then to cases for books, cabinets, and cupboards of any kind, and to any room or place for holding tools, books, &c., and, finally, to the shrine-like cippi, or ædiculæ, containing family portraits, reproduced in wood, stone or metal from the "imagines Majorum," or painted wax masks taken of the Roman nobility immediately after death. The practice of taking these post-mortem masks appears to have been almost universal in antiquity. It was followed by the Egyptians, Assyrians, Phœnicians, Carthagenians, and Italians, and it accounts for the lifelike character of their sepulchral portraiture, and particularly for the vivid individuality of the busts and portrait statues of the distinguished Romans which have come down to our time. There is in the Lateran a so-called armarium, of the Imperial Roman period, of a female member of the family of the Haterii. It was found with other funerary sculptures, all mural, of the family, on the Via Labicana, not far from Centocelle. The equipment* (whence possibly the designation "armarium") or framing of the bust presents a simple pediment, supported by a pilaster on either side and by a rounded pillar a little in front of the pilaster to the right of the bust. The pillar on the opposite side is absent, and appears to have been broken away. On either side, at different levels, there is a bracket between the pilaster and the pillar, intended for a lamp to be lighted in honour of the revered dead. The pediment, within its architectural mouldings, is trailed with flowers on either side of the representation, apparently of a lighted lamp. The pilasters are scrolled with heartsease, while the remaining pillar is delicately imbricated. The bust rests on a narrow broken ledge of marble, and this "armarium" evidently wants its proper plinth; yet, as it stands, in the appropriateness and the religious sentiment of its elegant and charming design, it is a perfect example of what the enshrining frame of a family portrait should be. The provision of the brackets for lamps at once fascinates the beholder, recalling the daily ceremonial commemorated in the hymn of Prudentius, "Ad incensum Lucernæ;" a beautiful and solemnising domestic rite which ought never to have been allowed to pass into disuse. But it is probably to the "consular diptychs," of the fourth and fifth centuries A.D., that we must look as the immediate precursors of the modern picture frame. The diptych and the triptych—"pictura in tabula"—had probably always existed; and Rich illustrates a triptych from a Pompeian mural painting, the exact location of which he does not give, as suspended, with a considerable forward slant, over a doorway. Under the Lower Empire, the custom prevailed of the consuls and other magistrates, on entering office, presenting their friends and patrons, as also the Christian bishops to whom they wished to be civil, with folding tablets of ivory or wood, having their names and their portraits and their insignia of honour carved thereon. These were in fact their *cartes de visite*, and he (Sir George Birdwood) would fain see the fashion of them revived to the exclusion of the egregious photographic *cartes*. The edges of these consular diptychs are nearly always framed round in low relief with conventional decorations, identical in design with those of the frames of gilded "gesso," or of gilded and stamped paper, applied along the edges of the painted diptychs and triptychs and other wood-panel ikons found at the present day among the Greeks and Russians and Copts and Abyssinians. Labarte, in his "Handbook of the Arts of the Middle Ages," in the chapter on "Painting and Caligraphy," at one time inseparable arts, gives three illustrations which seem to me very suggestive of the gradual transformation of the panel ikon and diptych and triptych, edging or "selvage"—if the word may be so used—into

* I use "equipment" to avoid the use of "frame," here usable only in the sense of the whole shape, form and structure—including the bust or other sculptured subject—of this armarial type of mural monument. Armarium, among other things, means specifically a marine store; "armare" meaning [Charta Alfonsi reg: Aragon: 1288] to fit out, equip, a privateer; and in the case cited in the text the armarium is the complementary part, which, with the bust, fully equips, and gives form and shape to the memorial. [Equip, shape, and ship are the same word, and "ship-shape" a tautology.] Armarium is used also by Tertullian for the completed canon of the Hebrew Scriptures. We have, on the other hand, armariolum, for the tabernacle in which the Corpus Christi was carefully kept under lock and key [Statua Ecclesiæ Leodiensis, 1287], and in Low Latin, armariolus, for the little chest in which certain of the utensils used in the offices of the Christian Church were kept beside the High Altar; in these two instances armarium corresponding with the pagan Sacrarium, in which the salinum paternum, patella, and other sacred and mystic ancestral and progenitory symbols, were kept by the Romans.

the modern picture frame. The originals of the illustrations are all in the National (formerly Imperial) Library at Paris. The first, from a miniature of the fifteenth century, representing a female statue painter, has behind the statuette of the Virgin and Child a panel ikon of the Saviour's head, with a heavy stamped and obviously gilded "selvage." The second, from a MS. also of the fifteenth century, representing a caligrapher at work, has at his feet a panel painting of the Crucifixion, the "selvage" of which is considerably raised above the surface of the paper. The inner edge of the "selvage" is obviously "bevelled" to the surface of the painting. The third, from another MS. of the fifteenth century, represents a female artist at an easel, painting a picture of the Virgin and Child, already fixed in a round moulded frame, with apparently the ring for hanging the frame fastened to its top. The parallelism as regards "motives," and the details illustrating them, between the above fifteenth-century miniature and the Pompeiian fresco of another female artist painting a Hermes, described by the speaker at the commencement of his remarks, was remarkable and profoundly interesting. "Plus ça change plus c'est la même chose." Even more remarkable is the proof of the continuity of artistic methods and appliances, afforded by a painting in a fifth-century MS. of the "Materia Medica of Dioscorides" at Vienna, representing an artist copying a mandrake plant, held up before him by the goddess Euresis, on a quarto sheet of vellum, fastened to the drawing board resting on the easel by six "drawing-pins." The speaker said he thought that in these few references, which might be indefinitely extended, he had sufficiently traced the true pedigree of all the traditionally modern varieties of picture frames, and pointed out the direction in which to look for promptings for their improvement. The Italians of the Renaissance modelled their best picture frames from these ancient armaria, cippi and ædiculæ, as is very clear from the actual examples, and the reproductions, of Italian Renaissance frames in the South Kensington Museum; and it is equally clear that Sir Frederick Leighton and Sir Philip Burne-Jones were directly inspired by the later in designing their classical frames, which, in Sir Frederick Leighton's hands, always harmonise perfectly with the pictures they contain. If he might generalise from the instances cited, he strongly advised the revival of the use of wood or metal or composition, self-edged panel for trivial paintings; while for family portraits and great imaginative pictures he would like to see the fullest development given to the picture frame as a shrine; and of course to the enframing by moulding, niche, canopy or other equipment of statuary. But the great point was that the artist should have the first and last word in the framing of his work; it should be part of his covenant alike with the patron and the dealer in frames, who both require to be taught that frames have to be made for pictures, and not pictures for frames—not since sculpture and paintings rose above their restricted status as the handmaids of architecture and became independent fine arts. The frame and its picture are commutually inseparable as the wine cup from the red wine in it, and as the setting of a jewel from its priceless gems. In the words of Schiller, truth is independent of its vehicle, but beauty is made perfect alone by its environment, literally "the vessel makes the content"—"Bei dem Schönen allein macht das Gefäss den Gehalt."

ANDREA DEL CASTAGNO'S "ST. JEROME."

AN Italian contributor of the *Scotsman*, writing from Florence, says:—

If, in her transition from a Mediæval to a nineteenth-century city, Florence is depriving us of many a historic building or landmark, she affords us some compensation by the concurrent unearthing of a remoter past and the resuscitation of art treasure long over-laid. In the latter direction she has, within the past eighteen months, given back to us two masterworks, known, indeed, to the history of painting, but buried for centuries under far inferior productions. The first of these, the famous "Pietà" of Ghirlandaio, came in the nick of time to enrich the celebration of the fourth centenary of Vespucci with the finest presentment of that great geographer and explorer yet revealed. The second "resuscitation" is of still higher artistic, if of inferior historic, import—that of the magnificent fresco by Andrea del Castagno representing St. Jerome, with the familiar lion beside him, between two Maries in praying attitude, and, above, the Trinity, with the crucifix "che scorta," as described by Vasari. The mighty theologian, scholar and hermit, "secco e roso" (dry and shrivelled) as the parchments over which he pored, is depicted with consummate power; the colouring retains much of its original brilliancy; the fresco, indeed, is all but intact, and, most satisfactory to relate, it has quite escaped the compromising touch of the restorer. The world is now the richer by another masterpiece of a painter whose authentic work is about as rare as that of Giorgione, and hardly less precious—work to which I shall allude presently as indicating a strength of character and an independence of thought as superior to the "formal idealism" of its epoch as it is to the "loose realism" so often accepted as "truth to nature" in contemporary art.

The circumstances in which the discovery was made are worth recording. Just as in Rome the munificence of King Frederick William of Prussia in 1829 founded the Archæological Institute which, under Gerhardt, Von Platen, Bunsen, Becker, Jordan, Henzen and Mommsen, has done such splendid work as to justify the assertion that (till lately, at least) "restored Rome is a German city," so in Florence there has for some time existed a parallel German institute—"Un Istituto di Storia dell' Arte"—composed of art students from the Fatherland, who, with equal intelligence and ardour, make it their task to study Florentine painting, sculpture and æsthetic production generally in its every phase and period, collecting from all sources whatever work or documents can illustrate or throw light on the theme. Its director is Professor Brockhaus, one of its "members of council" is the Commendatore Herr Marcuard, and Dr. Warburg and Dr. Horn are two of its most accomplished representatives. These gentlemen waited the other day on the Syndic of Florence (the Marquess Pietro Torrigiani) and the "Commissario dell' Ufficio Regionale" and craved permission to institute a search for the very valuable fresco of Andrea del Castagno, known to have been painted by that master for the "Cappella dei Montaguti" (chapel of the Montagues) in the church of the SS. Annunziata, in the piazza of that name—a fresco of which all trace had been lost since the "restoration" to which the said chapel had been subjected 350 years ago. Their petition was granted with every expression of goodwill by the "Rappresentante del Comune," in whose keeping the church of the SS. Annunziata lies, and every facility was vouchsafed them for the prompt and thorough tracking out of the hidden treasure. Yesterday they had their reward. In co-operation with the "Commissario dell' Ufficio Regionale," whose authority was required for the proceeding, they removed from the chapel wall the "pesantissima tavola" (very heavy picture) painted by Allori, and, sure enough, came upon the "splendido affresco" underneath it—the object of their quest—Andrea del Castagno's masterpiece, just as described by Vasari.

The moment was an inspiring one, and the feelings of the savants present were happily interpreted by the Commendatore Herr Marcuard as, addressing the Inspector of Monuments (the Cavaliere Carocci), the engineer Signor Bondi of the "ufficio technico" of the commune, some of the "Padri Serviti" attached to the church, and certain of the members of the "Instituto Germanico," and other art students, he pronounced the following words, "molto cortesi e molto opportune" (very gracious and very well-timed):—"Gentlemen, the task which has brought us here having been completed, I feel it my duty, in name of all students and lovers of art, to thank the honourable Syndic of Florence for the permission vouchsafed us to make the desired investigations in the church of the Santissima Annunziata, which is in custody of the Town Council. I have also to thank the 'Commissario dell' Ufficio Regionale' in charge of the Conservation of Monuments, and, in an especial degree, the Marquess Torrigiani and the Cavaliere Carocci, for their valued co-operation; and also the reverend 'Padri Uffizianti' (officiating clergy) of the church for their genial aid. Certainly the restoration to light of the fresco of Andrea del Castagno, described so minutely and so exactly by Vasari, is an important event for the whole world of art, which will be hailed with joy by the city of Florence, enriching herself as she has now done by another artistic gem of most precious merit." In reply, the Cavaliere Carocci, in the name of the whole company, thanked the Commendatore Herr Marcuard, as representing the "Instituto Germanico," for its valuable contributions to Tuscan art history, and for such treasure trove as the newly resuscitated fresco, by which the artistic patrimony of Florence was so opportunely enriched. All Italian students and lovers of art, he concluded, felt themselves honoured in having as fellow-workers such learned, such discriminating, and such warm votaries of Italy's "glorie più serene" (serener glories) as the members of the "Instituto Germanico." Thereafter the assembly broke up and went its way, while the event of the morning was communicated by telegraph to his Excellency Dr. Baccelli, Minister of Public Instruction.

For weeks to come—indeed, with each successive season during which Florence gives hospitality to the world of travel—the "St. Jerome" of Andrea del Castagno will be a "point of pilgrimage" for all art votaries. It will have the effect, moreover, of drawing attention to another authentic work of the same master—the "Cenacolo" ("Last Supper"), in the old conventual establishment of the Santa Apollonia in the street once so called, but now rebaptized (according to a regrettable innovation practised all over Italy), by another name, the Via Ventisette Aprile. The painting, by no means recognised as its power and originality entitle it to be, is remarkable for the

severe, some might call it the coarse, realism of its presentment of the Saviour and His Apostles. Our Lord is reproduced as a red Jew of distinctly plebeian aspect, with a head of great capacity and features full of benevolence and humanity; while His disciples, with the exception of St. John, are equally depicted as neither more nor less than the humble, unpretending, honest peasants or bourgeois they undoubtedly were. St. John is saved from the general rusticity by the refinement of his expression; but all the rest, from St. Peter downwards, are neither more nor less than the fishermen and "petite bourgeoisie" introduced to us in the Gospels. The daring which put before the world this "Houndsditch Cenacolo," as it has truthfully but irreverently been called, can only be estimated after comparing it with the idealised, over-refined, quite unnatural types almost universally given in paintings of the same subject by del Castagno's contemporaries. And yet how strongly impressive, how touchingly naïve, are the figures and their grouping. In guide-books the fresco is called "painful." But surely the epithet is ill-chosen. It is no more "painful" than Michel Angelo's Christ with His Cross in the "Santa Maria sopra Minerva" in Rome—a sculptured figure in which the great artist gives the lie to the "namby pamby," not to say "spoony," conceptions of the Saviour appealing to us *ad nauseam* in so many post-Renaissance churches. Del Castagno's Christ and His Disciples, as given in the "Cenacolo," would, it is not too much to say, have won from Michel Angelo an appreciation he would have withheld from nearly all contemporary pictures on the same theme—instinct as it is with the strength that "looks facts in the face," that strives to reproduce nature as she presents herself "unadorned," and that scorns to court popularity by playing up to its prejudices in the perpetuation of an effeminate tradition.

ARCHÆOLOGICAL EXPLORATION IN CRETE.

AN appeal for funds for explorations in Crete has been issued by Mr. A. J. Evans and Mr. D. G. Hogarth, director of the British school at Athens. They say:—

The new conditions in which Crete is placed and the final emancipation of the island from Turkish rule have at last rendered it possible to organise a serious effort to recover the evidences of her early civilisation.

How important are the results which a thoroughgoing investigation in this field holds out to archæological science may be gathered from what has already been brought to light in far less favourable circumstances. The path of Cretan exploration was opened out by the English travellers Pashley and Spratt. Their exploratory labours have been followed in more recent years by the striking discoveries of Halbherr and Fabricius. The great inscription containing the early laws of Gortyna stands alone as a monument of Greek civic legislation. The bronzes of the Idæan cave have afforded a unique revelation of the beginnings of Classical Greek art. Future researches, to which English investigation has once more contributed, have brought into relief the important part played by the still earlier civilisation of Mycenæ, the wide diffusion of its remains and even the existence in the island of an indigeneous system of sign writing anterior to the use of the Phœnician alphabet. Additional indications, indeed, have come to light which carry back the chronology of the earlier relics of Cretan culture far beyond the date of Schliemann's great discoveries on the mainland of Greece, and attest an intercourse with Egypt going back to the third and, it may be, even the fourth millennium before our era. We have here in Crete the first stepping-stone of European civilisation.

The better to solve the many interesting problems thus opened up it has been decided to form a "Cretan Exploration Fund," under the direction of the undersigned and in co-operation with the British School at Athens, in order to carry out a series of comprehensive excavations. We have pleasure in announcing that His Royal Highness Prince George of Greece, High Commissioner of the Powers in Crete, has graciously consented to become patron of the fund.

Thanks to the kind support extended to the scheme by His Royal Highness the High Commissioner it has been possible to secure for British enterprise a series of sites selected for their historic importance or specially representative character. At Knosos—the city of Minos and the Labyrinth, of Dædalus and the "Choros" of Ariadne, the traditional centre of the ancient sea-power of Crete and its earliest school of art—one of the first objects inviting excavation is a mound containing the ruins of a prehistoric building, the exploration of which had been already one of Schliemann's ambitions. At Præsos, another site reserved to us, it is hoped to lay bare the chief stronghold of the original Eteocretan race, where an archaic inscription in an indigenous and still undeciphered dialect has already been discovered. Lyttos, which is also included in the scheme, was regarded as the model Dorian city, and the fragments of its ancient laws that have come to light on its acropolis height give hopes of considerable epigraphic results.

The part which caves have played in the early religion of Crete has been very important, and three of these containing votive deposits of great antiquity have been secured for investigation. Of these the great cave of Psychro on Mount Dikta, the legendary birthplace of Zeus, promises results not inferior to those obtained from his cave sanctuary on Ida. The investigation of some prehistoric sites on the south-east coast of Crete, also included in the present plan, is expected to throw a valuable light on the early intercourse on Egypt.

In order fully to realise this comprehensive scheme of investigations it will be necessary to raise a sum of at least 5,000*l*. The object has a real claim on British enterprise. From a national point of view, this task of scientific exploration in Crete is a fitting sequel to the joint work of political emancipation in which we have taken part. It may be mentioned in this connection that the French School at Athens is already organising plans of excavation on other Cretan sites and that a mission with a similar object is being despatched by the Italian Government.

It is intended that the chief results of the excavations shall go to enrich the national Cretan Museum, a very interesting nucleus of which has been already put together. It is proposed to adapt for the purpose the old Venetian Armoury of Candia, and the directors of the fund hope to be able to devote some portion of it to the proper location there of the objects brought to light. A house in Candia has been already secured and furnished to serve as headquarters for the fund. Mr. George Macmillan has kindly undertaken to act as treasurer to the fund, and subscriptions may be paid either to him at St. Martin's Street, London, W.C., or into the account of "The Cretan Exploration Fund" at Messrs. Robarts, Lubbock & Co.'s, Lombard Street, E.C.

GLASGOW INSTITUTE OF ARCHITECTS.

THE annual business meeting was held in the rooms, 187 Pitt Street, on the 6th inst., the president, Mr. George S. Hill, in the chair. The business of the evening comprised the reading of the secretaries', treasurer's and librarian's reports, which were adopted, and the election of new office-bearers for the ensuing session. The following gentlemen were elected to office:—President, Mr. John Fairweather; vice-presidents, Mr. Chas. E. Whitelaw, Mr. Wm. J. Blain; secretaries, Mr. Alex. Wingate, Mr. Thos. Ramsay; treasurer, Mr. Walter S. Tucker; librarian, Mr. Andrew Rollo; general committee—Messrs. Geo. S. Hill, Jas. Lochhead, Alex. M'Gibbon, Jas. M'Kissack, Alex. Davie, Wm. Vickers, Wm. S. Lukeman and Robert J. Walker. A vote of thanks to the retiring president, Mr. Geo. S. Hill, concluded the business.

GENERAL.

The London County Council have agreed to appoint an assistant architect at a salary of 800*l*. a year.

A Pavilion of novel design is to be constructed for the Principality of Monaco in connection with the Paris Exhibition. The architects are MM. Medecin and Marquet. The contract was arranged on Saturday last.

The Society of Architects propose to hold provincial meetings at Sheffield and possibly other provincial centres towards the end of June, with a view to bringing forward the question of the Architects' Registration Bill, and also matters affecting the state of the law in regard to "light and air" cases.

The Conversazione of the Society of Arts will take place at the Natural History Museum, Cromwell Road, S.W., on Tuesday next. The reception by Sir John Wolfe Barry, K.C.B., F.R.S., chairman, and other members of the Council will commence at 9 P.M.

The Dean of Christ Church Cathedral, Dublin, appeals for funds to meet the unusual expenditure for the removal of the monuments in the crypt, hot-air system of heating the cathedral, extensive improvement of drainage and sewage, and the better heating and lighting of the Grammar School.

A Laboratory for pathological studies is to be erected in Oxford at a cost of 10,000*l*., towards which an anonymous donor has contributed 5,000*l*.

A Statue of Charles Darwin, by Mr. Hope-Pinker, presented to the University of Oxford by Professor Poulton, and placed in the central court of the museum, was unveiled by Sir Joseph D. Hooper on Wednesday afternoon.

The Naval Barracks which are to be built at Portsmouth will accommodate 5,000 men. They are to cost 400,000*l*., and will have to be completed in three and a half years. The Anglesea barracks and the military hospital will be demolished in order to make room for the new buildings.

THE

Architect and Contract Reporter

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to rise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. *on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-Rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, Imperial Buildings, Ludgate Circus, London, E.C.

For Advertisement Scale, see page xiii.

COMPETITIONS OPEN.

HARROGATE.—July 3.—Premiums of 150*l.*, 100*l.* and 75*l.* offered for designs for erection of a new Kursaal, &c., in connection with the Spa Concert Room. Cost not to exceed 5000*l.* Mr. S. Stead, Municipal Offices, Harrogate.

PLUMSTEAD.—July 27.—Designs are invited for proposed new municipal buildings and public library, at a cost of about 40,000*l.* Premiums of 100*l.*, 75*l.* and 50*l.* Mr. Edwin Hughes, vestry clerk, Vestry Hall, Plumstead.

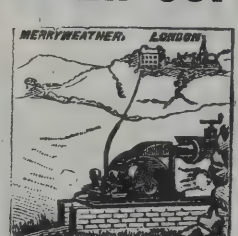
ST. MARY, STRATFORD-LE-BOW.

THE parish church of St. Mary, Stratford, Bow, was reopened after having been closed for upwards of two years. In October 1895 a portion of the chancel roof subsided, and it was then found that the whole church was practically tumbling down. Consequently it had to be closed. The origin and date of erection of this church have been matters of dispute, but in 1311 Bishop Baldock granted the inhabitants of Stratford and Old Ford a license authorising them to erect a church in the king's highway, on account of the distance of their residences from the mother church of Stepney. The architecture of the church points to the fact that the building is not of an earlier date than the latter part of the fifteenth century, but it is believed the present church took the place of a chapel which had previously existed on the site. Sir Walter Besant, in his book "London," wrote :—"It was formerly the church of a nunnery founded at Stratford-le-Bow by William the Conqueror; it was augmented by Stephen, enriched by Henry II. and Richard I., and lasted till the Dissolution." The church remained a chapel of ease to Stepney until 1719, when it was consecrated as the parish church. A new roof has now been provided to the nave, while the gable roof of 1755 has practically been renewed. The brick gable has been rebuilt, but the old timbers have been left. The tower is now the only part of the church to be repaired, and before that can be done a sum of about 1,800*l.* must be collected. The opening service was conducted by the Rev. Manley Power, the rector, assisted by many of the local clergy, while the Bishop of London preached the sermon. Messrs. W. A. Hills & Son were the restoration architects.



A MEETING of the St. Helens' Corporation parliamentary and official staff committee was held on Saturday, when the eight candidates for the vacant town-clerkship selected to appear before them were interviewed. Ultimately Mr. T. B. Blackburn, assistant registrar of the Chancery Court of the County Palatine at Liverpool, and Mr. G. W. Bailey, town clerk of Eccles, were selected to appear at the next meeting of the Town Council, when the appointment will be made. The other candidates interviewed were gentlemen connected with the corporations of Blackpool, Cheltenham, Bootle, Congleton, Southport and London.

MERRYWEATHER & SONS, Ld., the Largest Makers of High-Class Hose in the World.

GREENWICH ROAD S.E., & 63 LONG ACRE, W.C., LONDON; AND AT MANCHESTER.

TRADE NOTES.

THE reglazing of the Crystal Palace roofs has been entrusted to Messrs. Mellowes & Co., of Sheffield and London (28 Victoria Street, Westminster, S.W.), on their "Eclipse" patent imperishable system.

MESSRS EDGAR KEELING, TEALE & CO, LIMITED, have been entrusted with the execution of the wrought-iron staircase and railings at Kensington Town Hall extension.

THE heating of the new P. M. chapel, Nelson, is to be by Spencer's patent "Ventilo" radiators. The patentee and sole maker is Mr. W. F. Spencer, Cross Bank Works, Oldham, and 145 Queen Victoria Street, London, E.C.

IN the ventilation of St. Peter's Episcopal Church, Glasgow, now in course of erection, Mr. James Chalmers, architect, "Cousland's improved Climax" patent direct-acting invisible roof ventilators are being used.

THE Angel Hotel, Peterborough, is being fitted with an entirely new installation for its complete warming and ventilation, by John King, Limited, engineers, Liverpool, by means of their "Rajah" ventilating radiators and their patent "Tubular" exhaust ventilators.

MESSRS E. H. SHORLAND & BROTHER, of Manchester, have recently supplied their patent Manchester grates to the Isolation Hospital, Braintree.

THE Silicate Paint Company (J. B. Orr & Co., Limited) inform us that the recently opened Hotel Great Central has been decorated throughout with their enamel paint, and nearly all in white.

ELECTRIC NOTES.

AT a meeting of the Scarborough Town Council on Monday evening it was decided to purchase the old gaol site for the erection of the proposed refuse destructor.

THE Local Government Board have sanctioned powers for the Corporation to borrow another 28,870*l.* for extending the electric-lighting works and cables for both public and private lighting. The committee have agreed to accept a tender of Mr. J. O. Brettell, of Worcester, for 2,218*l.*, for the construction of a new battery-room at the works

THE purchase of the Sheffield Electric Light and Power Company by the Sheffield Corporation was completed on Monday, the 12th inst, when the shareholders in the company received a final distribution of assets. The purchase money has been sufficient to pay 17*l.* 19*s.* on every 7*l.* share.

AT a special meeting of the Oswestry Town Council on Tuesday evening, it was resolved to acquire the Oswestry Electric Light Company's undertaking at a sum not exceeding 11,750*l.*, which is the price asked by the company. Mr. Hawtayne, an electrical expert called in by the Council, valued the property at 8,250*l.* Several members severely criticised the proposal on the ground that the price was extravagant, and a poll of the ratepayers was demanded.

THE Southampton Corporation electrical engineer has reported to his committee that the number of units sold during the month for private lighting and power was an increase of 70 per cent. on the number sold in May 1898, and that the equivalent to 717 8 candle-power lamps was connected during the same month, and that applications continued to come in freely, especially from the districts supplied from the new mains.

MR. W. O. E. MEADE-KING, C.E., opened an inquiry at the Council Chamber, Darlington, on Friday last, into an application on the part of the Corporation of Darlington for sanction to borrow 30,000*l.* for the purpose of electric lighting, and 591*l.* for the purchase of land in Haughton Road for the extension of the depot. The Town Clerk stated that a provisional order had been obtained. It was not intended at the outset to spend the whole of the 30,000*l.* by 4,215*l.*, which balance would be left for future extension.

THE streets electric-lighting sub-committee of the Glasgow Corporation have considered proposals from the electricity committee offering to supply the current for street lamps at the rate of 14*l.* per lamp for all-night lighting, or 12*l.* per lamp should each alternate lamp be extinguished at 11.30 P.M., on the understanding that the minimum number of electrically-lighted street lamps in the city be raised to 400. The sub-committee remitted to Mr. Hamilton, the inspector of lighting, to prepare a report on the requirements of the leading thoroughfares for presentation to the watching and lighting committee, with a view of making recommendations for the extension of the system.

THE lighting committee of the Wolverhampton Corporation, in their annual report, state that their operations in regard to the electric-light undertaking have again been successful, a profit of 1,004*l.* having been made after payment of interest and

sinking fund charges. Of this amount 588*l.* has been applied to clear the deficiency on the working of the previous years, and the department has now in hand 416*l.*, which it is proposed to carry forward to revenue account for next year's working. During the four years the number of lamps connected has increased from 8,941 to 19,932, the consumers from 113 to 276, and while there was a loss on the first year's working a progressive profit has since been earned. There are satisfactory signs that progress will be continued. Up to the present date two alterations have been made in the tariff charged to consumers. The first of these resulted in 71 customers out of 164 (or 43 per cent.) obtaining a rebate. The second alteration has resulted in 176 out of 267 (or 65 per cent.) obtaining a rebate. The average price paid by the consumers for lighting during the past year was 5·24*d.* per unit, and for power and heat 1·7*d.* per unit. The object of the committee in effecting these alterations has been to encourage the use of electric lighting by those people who use artificial light for periods of several hours daily, and also to encourage shopkeepers to extend the light into the back part of their shops and residential quarters, many shopkeepers only using the light in their windows.

VARIETIES.

MR. ANDREW CARNEGIE has offered 1,000*l.* for the purpose of building a free library in the burgh of Banff. The Free Libraries Act was adopted by the burgh a few weeks ago.

AN excellent sixpenny treatise on sanitation has been issued by the St. Bride's Press, Limited. It is entitled "Examinations in Sanitary Science." The author, Mr. E. R. Matthews, has collected various examination papers, and has given explicit answers to the questions. Beyond its use to candidates it serves as a useful manual of information on an important subject.

THE Phœnix Bridge Company of America has received a contract to build a large steel bridge for the Imperial Railway of Japan. The bridge will be in six spans, and will be one of the largest steel bridges ever contracted for by American builders. As soon as the plans are completed work will be begun, and the bridge is to be ready for shipping by September 1.

ON the body of one of those who perished in the loss of the *Stella* was found an insurance ticket for 500*l.*, granted on the morning of the wreck by the Railway Passengers' Assurance Company. The body had been floating in the Channel for nearly two months. The ticket was found intact. This fresh claim makes the total amount claimed from the company in respect of deaths by the *Stella* 5,000*l.*

A CARVED oak reading-desk has just been placed in the parish church at Little Wenlock, Shropshire, in memory of the late Rev. Canon Nash, for nine years rector of the parish, who died last year. It has been erected by the parishioners, with the help of Lord Forester, patron of the living, and other friends of the late Canon. The reading-desk has moulded and panelled standards and open tracery between, surmounting a closed panel, which bears a suitable inscription cut in the oak. The whole is of very solid workmanship. It has been designed by Mr. W. Arthur Webb, of 2 Colville Square, W., and carried out by Mr. T. Martin, of 118 Victoria Street, S.W.

THE new church of All Saints, Farnworth, Bolton, was dedicated on the 8th inst. The new building is the outcome of a movement started about three years ago by the Rev. H. E. Burgess, curate-in-charge, to increase a sum of 1,000*l.* bequeathed by the late Mr. John Greenhalgh to the wardens of St. John's, Farnworth, towards the cost of erecting a new church at All Saints. Already the sum raised represents about three-fourths of the entire cost. The church will for the present provide accommodation for 450 persons. It has been built from the plans of Mr. R. K. Freeman, Bolton.

THE Caledonian Railway Company have effected an extensive purchase of property in Glasgow immediately to the north and east of their Buchanan Street terminal station. It is understood, says the *Scotsman*, that the purchase includes the whole of the area enclosed by Port Dundas Road, East Milton Street and Dobbie's Loan, and the frontage to these streets is over 700 yards. Although not officially announced, there is no doubt that the directors of the Company now recognise the impossibility of concentrating the whole of the traffic at the Central Station, and the new acquisition of property may be taken as the preliminary to a scheme for the reconstruction of Buchanan Street passenger station on a scale worthier of the reputation of the company than the present old and somewhat dilapidated buildings.

THE new Free church at Carnock, N.B., which was formally opened by the Rev. Principal Rainy on the 7th inst., has been erected from plans prepared by Mr. A. Scobie, Dunfermline, and is a neat Gothic structure seated for 300 persons. There is a hall at the back for Sunday school and other meet-

ings. The contractors were:—William Templeman, Cairneyhill, mason; David Graham, Dunfermline, joiner; Messrs. M'Gregor & M'Ouan, Inverkeithing, slaters and plasterers; Messrs. Muir & Gillan, Dunfermline, plumbers; Alexander Lowe, Dunfermline, glazier; D. Lowe & Sons, Edinburgh, heating engineers; Charles Wilson, Carnock, iron-work (gates and railings); Henry Hoggan, Dunfermline, painter.

ST. PETER'S Presbyterian Church, Upper Tooting, which was on the 8th inst. dedicated to public worship, introduces into this country a somewhat new departure in church architecture. The church has been built from American designs, which are said to combine the most practical seating arrangements with excellent acoustic properties. The method of construction, which is now popular in the United States and Canada, solves what an Irish divine once called "the problem of having a central pulpit in a corner," the pulpit, with the organ behind, being placed in one of the corners, and the pews being arranged therefrom in concentric lines. The new church, which has a spacious gallery, will seat over 700 persons. Presbyterianism has been making rapid strides in this district, and a long-felt want has been supplied by this important extension of church accommodation.

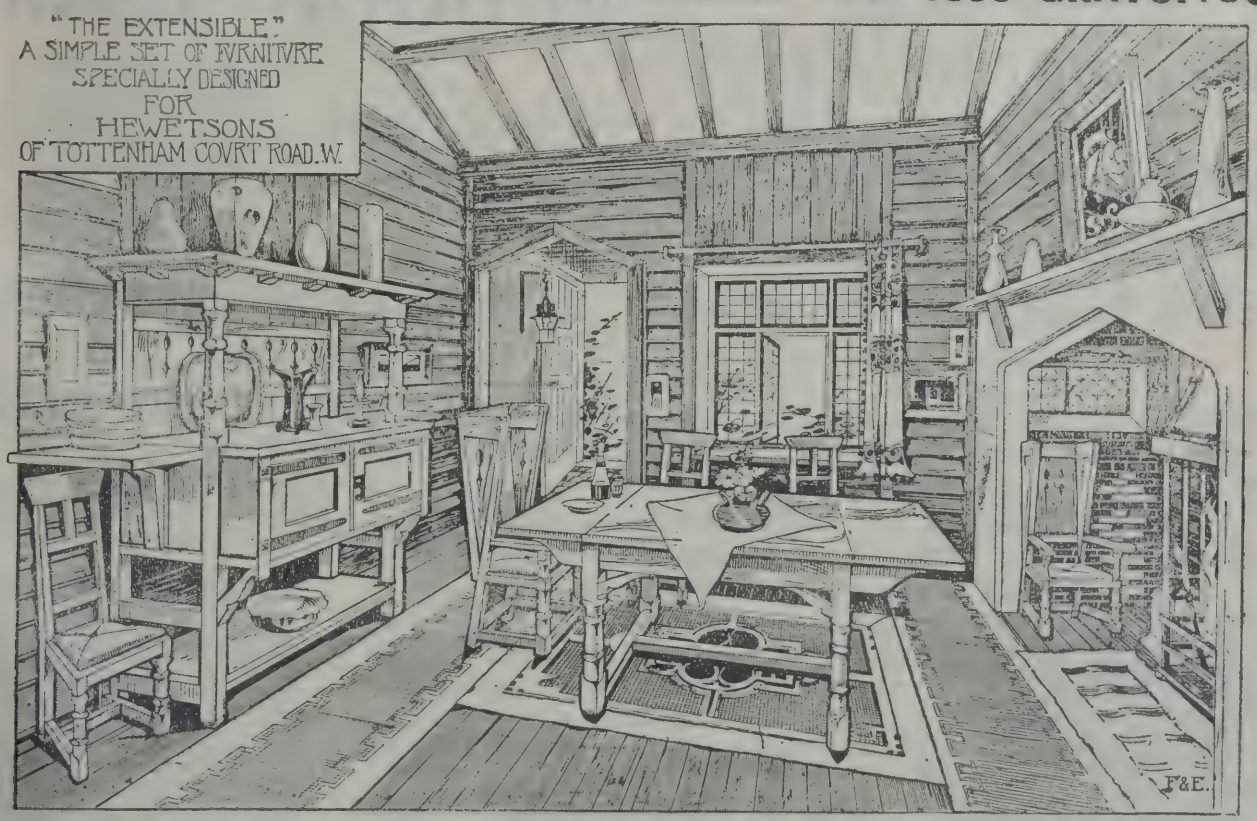
A NEW swimming-bath, which has been erected at Wantage as a memorial of the Diamond Jubilee of the Queen, was opened on the 1st inst. The inside dimensions are 48 by 30 feet, the depth of water being 3 feet 3 inches at the shallow end, and 5 feet 6 inches at the deep end. The supply of water is brought down in cast-iron pipes from the pond in the Market Place, which is supplied from the conduit in Newbury Street. A small filter is fixed in the pond, so that all water entering the bath is passed through a bed of gravel. Two inlets are provided with the necessary valves for shutting on or off and emptying the main. The capacity of the bath is 39,375 gallons, the weight of water being 176 tons. An entrance lobby, attendance-room, six enclosed dressing-boxes, and an open shed with seat have been built. The bath, which has cost about 400*l.*, was built by Mr. W. A. Wheeler, from the design and under the superintendence of Mr. W. Hanson.

BUILDING AND BUILDERS.

THE Prince of Wales visited Winchester on the 8th inst., and l id the commemoration-stone of the new barracks which are t be constructed on the site of the old King's House.

ILLUSTRATIONS.

CATHEDRAL SERIES.—ROCHESTER: NAVE, LOOKING WEST.—DOORWAY IN SOUTH CHOIR TRANSEPT LEADING TO CHAPTER-HOUSE.—DETAILS OF WEST DOORWAY.



QUEEN'S HOTEL, LEICESTER SQUARE.—GRILL ROOM.

ON Wednesday afternoon the foundation-stone was laid of the new church of St. Barnabas, at Ladypool Road, Birmingham. When completed the church will take the place of a small iron building, which has accommodation for only about 600 persons, and is found to be totally inadequate for the requirements of the large and populous district in which it is situated. The plans, prepared by Mr. T. Frederick Proud, architect, provide at present only for the erection of a chancel with organ-chamber and vestries, but when complete the church will consist of a wide nave, aisles, transepts and morning chapel. The chancel will be 24 feet wide with apsidal end, the morning chapel and organ-chamber being separated by richly-moulded arches. At the corner of Ladypool and Clifton Roads a tower will be erected, under which is the main entrance. A projecting octagonal baptistery adjoins, and above rises the end of the nave with a group of lofty traceried windows. The south side shows a range of traceried clerestory windows and bold buttresses. The style is Late Perpendicular, and the whole building both inside and outside will be constructed of red brick, with moulded terra-cotta arches and tracery, and covered by a bold open timber roof and green slates. The church will hold 900 people, and the cost, exclusive of the tower, will be 6,000*l.* The builders are Messrs. E. Giles & Son, of Camp Hill.

AT a special meeting of the Bridlington Urban Council the sanitary and foreshore committee had before them tenders for carrying out improvements to the northern outfall, which runs on to the beach. One tender was from Mr. Brumby Robinson, Hull, and his price was 920*l.*, but a second price of 788*l.* was given if the work was done 6 yards further south. Mr. Sawdon moved that the latter tender be accepted, and the motion was carried.

A LABOURER named Peter Halsall, aged 28, met with his death under shocking circumstances at Bolton on Friday

EWETSONS ILLUSTRATED CATALOGUE FOR 1899 GRATUITOUS.

HEWETSONS, TOTTENHAM COURT ROAD, LONDON, W.

morning. Repairs are being carried out on the Lancashire and Yorkshire railway viaduct at Turner Bridge, and Halsall, whilst engaged at a crane, lost his footing and fell over into the valley below, a drop of 90 feet. He was conveyed to the infirmary, but died at noon.

A SAD accident occurred on Tuesday evening at North Shields. A gang of men were taking down a large building when one of the gables collapsed, and the men were buried in the débris. They were all got out safely except one man, named William Marcer, who was found to be dead. His son, who happened to be near the building at the time of the accident, was struck by the falling masonry and badly injured.

A PROVISIONAL agreement having been signed to build a dock at Workington, conditional upon the rejection of the Maryport Harbour Bill, the scheme will, now that that measure has been defeated, be pushed forward. It is understood that the parties to the agreement are the Corporation, a London syndicate and the trustees of the Lowther estates, who own the present dock. The Corporation is to provide 150,000*l.*, half to rank as Four per Cent. Preference shares and half as Ordinary shares.

THE fortnightly meeting of the Liverpool Select Vestry was held at the public offices, Brownlow Hill, on Tuesday, when the special committee on hospital accommodation at Highfield reported that they had consulted with the architects upon the modifications of plans advised by the Local Government Board, and they considered that the recommendations relative to the bay windows of the pavilions on the east side of the administrative block and to the dining-room and the nurses' home might be advantageously adopted. Instructions had been given to the architects to modify the plans to this extent. As to the suggestion that the pavilions should be two-storeyed instead of one-storeyed the committee could not accept it, and the medical officers were strongly of opinion that it was not desirable. The saving would not amount to more than 4,000*l.*, and this would not compensate for other serious disadvantages. Mr. Pickthall moved the adoption of the committee's report, and the motion was seconded by Mr. Laurence and carried.

AT a meeting of the Paisley Police Commissioners on Monday night, the report on the proposed refuse destructor works, prepared by Mr. Santo Crimp at the request of the Commissioners, was submitted. The destructor is to be of the Horsfall type. Dealing in his report with the question of sewage disposal, Mr. Santo Crimp explains the position of the Glasgow system on the south side of the Clyde, and instances how the burgh of Paisley will benefit by the construction of the Glasgow works, inasmuch as they will remove from the river Cart the pollution now discharged into it from districts on the upper reaches of the river. In this connection it is pointed out that certain advantages might accrue to Paisley if the town were joined with the Glasgow scheme. Two schemes are submitted—one for the burgh itself, and the other as joined with the city. The cost of the separate works would likely be 45,650*l.*, and it is estimated that the cost of purifying the sewage would be 1*s.* per head per annum, whilst the alternative scheme is estimated at 51,000*l.*, and to the interest of that sum the Commissioners would have to add the charges of the Glasgow Corporation for pumping and treating the sewage. The report, it was agreed, should be considered in committee. A further minute was read stating that the committee had visited a site in Underwood Road. Afterwards the Commissioners met in committee, and by a majority approved of the minute. After some discussion, and on a vote being taken, it was agreed by 12 to 7 to purchase the Underwood site, and it was remitted to the refuse destructor committee to carry out the arrangements.

AT Glasgow, Sheriff Spens, in a judgment just given, has dealt with several curious points of law under the Workmen's Compensation Act James M'Donald, house painter, 71 Reid Street, Bridgeton, sued Messrs. Hobbs & Samuel, house painters, 70 Anderston Quay, Glasgow, for compensation for serious personal injuries sustained by him while in the defenders' employment. On November 21 last he was engaged painting iron joists in the Dead Meat Market, Moore Street, and was using a ladder while doing so. While he was so employed the occupier of one of the stands in the market close to the ladder swung round the carcase of a bullock for the purpose of showing it to an intending purchaser, and the carcase coming against the ladder, the pursuer was knocked off and fell to the ground, sustaining a fracture of the skull and other serious injury. His lordship found that the Dead Meat Market is a building over 30 feet in height; but that, as a matter of law, the said building was not being "repaired by means of a scaffolding," and therefore that the accident was one which did not fall within the provisions of the Act. His lordship in consequence dismisses the claim, awarding no expenses. In a

ote he says that a ladder must be found to be "scaffolding" efore the claim could be sustained. In his view a scaffold vas a staging for the temporary use of workmen, and did not nclude a ladder, which was of a permanent character *per se*, nd not intended to be demolished when the job for which it vas used was finished.

THE foundation-stone of the new municipal buildings which re to be erected at Henley-on-Thames, was laid on the th inst. The new buildings, which are in the Renaissance yle, will contain in the basement a large drill hall and a orough surveyor's office. On the ground floor there will be vo committee-rooms and a council chamber, and upstairs will e a large hall, 60 feet by 40 feet, with seating accommodation or 450 people. The whole cost will be a little over 10,000*l.* he ceremony of laying the stone was performed by the Hon. *V.* F. D. Smith, M.P., and in asking him to do so the mayor Henley (Mr. Lidderdale) said the real foundation-stone was id some weeks ago, when they received such a handsome onation from Mr. Smith. After the foundation-stone had een laid the mayor laid a memorial-stone, setting forth the bject which the building was to commemorate, which was the mpletion of the sixtieth year of the reign of Her Majesty the ueen. The corner-stone was then laid by the Earl of Jersey, e lord-lieutenant of the county, with full Masonic ceremony, d the proceedings terminated. After the ceremony a pro- ssion was formed to Northfield House, the residence of the ayor, where lunch was served in the grounds, the mayor ing in the chair and Mr. R. T. Hermon-Hodge, M.P., in the e-chair.

GLASGOW'S new central fire-brigade station is now rapidly proaching completion, and is expected to be ready for ccupation in course of a month or so. In shape it is some- at like the letter L, one end abutting on Ingram Street and e other on High Street. A site better fitted for the use to hich it has been put could not have been found anywhere. shape has enabled the builders to place the various blocks buildings where they will be of most advantage. There are ree main structures, each separate from the other. The one Ingram Street, where the chief entrance is, has not yet been mpleted, but it is sufficiently far advanced for one to get an ea of what its general appearance will be when finished. e façade is 119 feet long and four storeys in height, and the ilding extends backwards from the street 40 feet. The vation, which is in Italian Renaissance, is divided into three mpartments, each surmounted by an ornamental gable, which agreeably breaks the sky-line. As far as the upper storey the building is constructed of polished Peterhead granite, which, in conjunction with the Dumfries red stone used for the rest of the structure, has a very handsome appearance. The effect is further enhanced by the chief rooms in the upper storeys having oriel windows, and the front, on the street level, being pierced with numerous arched openings. In the centre is the watch-room, an apartment 16 feet square, where men will always be in waiting to receive alarms of fire. On the right is the machine or fire-engine room, measuring 46 feet long by 36 feet wide, and lined with marble and granite in courses. Behind this is what is known as the "running stable," where eight horses in readiness for a "turn-out" will be kept. Above the engine-house is the "duty-room," from which access is had to the floor below by means of trap-doors with brass rods extending to the street level. On the left of the central compartment is the general entrance to the administrative department, in passing through which everyone must come under the observation of the watchman on duty. The other rooms on the street floor are occupied as an office, chief officer's room, officers' room, clerks' room, &c. At the extreme left of the Ingram Street front is the private entrance to the chief officer's dwelling-house of ten apartments. There are also in the block two officers' houses of six rooms, one of five, and other two houses of three rooms. The second block of buildings, which faces the High Street, has shops on the street floor with basements, which are quite separate from the fire establishment. The upper storeys are divided into sixteen houses of three apartments, with bathrooms. They are exceedingly well fitted up. Hot water is laid on throughout from a central boiler, and electric light will be furnished to the tenants. The elevation to High Street, while not so elaborate as the one in Ingram Street, is also of red sandstone, and is pleasingly decorated. The third block of buildings is across a courtyard. It is built of pressed terra-cotta brick and contains workshops of various descriptions, and above are fifteen dwelling-houses, each of two apartments, with bath-room, scullery and pantry. The accommodation provided for the men will make them more comfortable than they could ever have been in the old premises in College Street. Provision is made for drying their clothes when they return wet from a fire. There is a large general washing-house, fitted up with the same completeness as the public washing-houses of the city, with hydro extractors and a drying-room, and there is also a spacious laundry. A recreation-room has been built and there is also

a gymnasium 56 feet long by 24 feet wide. In case the wives of the men may be from home at any time a kitchen has been fitted up so that the men in the duty-room can cook their own food. At the south-west corner of the site a square tower 90 feet high has been built to dry the canvas hose, which rapidly deteriorates if it is stored away in a damp state. The top of the tower has been made flat to receive the standards for the telephone and telegraph wires connecting the central office with the district offices, and the street and other fire-alarms. The cost of the new establishment when completed will be about 66,000*l.*, of which 22,000*l.* was paid for the ground on which it is erected.

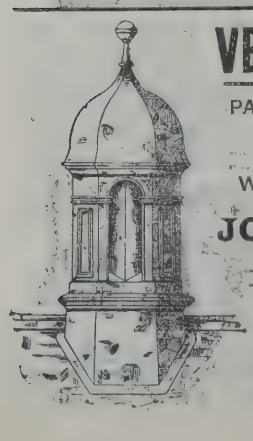
ROUS'S FIRE-RESISTING PLASTER.

ON Friday last a demonstration was given at Willesden of the practical utility of Rous's patent fire-resisting and non-conducting material for plastering, from which it was evident that the material in question will effectually arrest for a considerable time the progress of a fire, and protect the wood or iron which is plastered with it from the action of the flames for a sufficient length of time to allow them to be subdued by the ordinary means.

GREAT CENTRAL GOODS STATION.

AN interesting visit was made by the members and associates of the Society of Engineers on Wednesday, June 14, 1899, to the London station and goods depôt of the Great Central Railway, Marylebone.

Among those present were:—Mr. John Corry Fell, president; Mr. Charles Mason, vice-president; Messrs W. W. Beaumont, A. T. Walmisley, J. W. Wilson and Henry Adams, past presidents; Mr. Maurice Wilson, member of council; Captain Walter Wood, Messrs. S. Cowper-Coles, J Waddington, A. R. Burch, H. Conradi, William Sugg, John Samson, H. O. Carr, C. W. Wales, G. S. South, H. Stopes and E. Hulburd, members; Mr. Perry F. Nursey, secretary.



The Passenger Station—The passenger station consists of a brick and terra-cotta building having a frontage of about 325 feet, and containing the booking hall, waiting rooms, refreshment rooms, cloak room, parcel office, and other rooms with general offices overhead on the first and second floors. These rooms are all entered from the promenade, and the booking hall has also an entrance from the street under a covered way, which extends from the station to the hotel across the intervening roadway, which has a total width of 90 feet. The promenade has a width of 100 feet by about 250 feet, and from it the various platforms and lines of rails extend northwards. The promenade and the platforms and rails for a length of 500 feet are roofed over with a steel roof glazed with Mellowes' glazing, and supported upon steel stanchions. None of the spans exceed 50 feet in width, and the total width at present roofed over for platforms and rails is 155 feet. The company, however, owns the block of land lying to the west of the station, and between it and the new street called Harewood Avenue, for future extension by which the area of platforms and rail accommodation can be made double its present size. The platforms from the hydraulic buffer stops to the north end are about 1,000 feet in length. Owing to the fact that in former years the sand and gravel on the site of the building had been excavated and the space filled in with refuse, the foundations of the station had to be carried down about 25 feet below the platform level, and a basement was therefore constructed under the whole of the building. The portion under the refreshment-rooms has been made available for kitchens, &c., in connection with that department.

The Goods Depôt.—The goods depôt is situate with a frontage on one of the new streets made by the company, and called Rossmore Road, and extends northwards therefrom. The main building has a length of 384 feet by a width of 255 feet, and is constructed of brick walls with steel stanchions and girders carrying the various floors internally. There are five floors, consisting of the basement, ground and three upper floors. The ground floor is made at rail level, but trucks can be lowered into the basement by means of hydraulic waggon hoists. The whole of the machinery of cranes, hoists, traversers, capstans, &c., is worked by hydraulic power, and the building is lighted by electricity, the power and light being both provided from the hydraulic and electric power house belonging to the company in the vicinity. There is, in addition to the goods depôt proper, a large vault area under the road approach, a considerable amount of roofing on the east, west and sides of the building, and a large range of goods offices, with mess-rooms, &c., for the men fronting upon Lisson Grove, where the principal entrance to the goods yard and depôt is situated. It will be noticed in regard both to passenger and goods lines that the level of rails has been so arranged that at each place they are at the proper level for the most convenient access to the adjoining streets.

THE IRON AND STEEL INSTITUTE.

THE autumn meeting of the Iron and Steel Institute of Great Britain will be held in Manchester on August 15 to 18 inclusive. The meetings on August 15 and 16 will be held in the Town Hall. The programme embraces numerous visits to engineering and other industrial establishments. Thus on August 15 there will be a visit to the Lancashire & Yorkshire Railway Company's locomotive works and steel foundry at Horwich, and, alternatively, to the Simon-Carvès coke ovens at the Barrow Steel Company's collieries and at the Wharncliffe Silkstone Collieries, near Barnsley. On the following day there will be a trip on the Manchester Ship Canal, and on August 17 visits will be made to the works of Messrs. Platt Brothers and to the Pine Company's cotton mill at Oldham, and to Messrs. Galloway's boiler works at Ardwick and Messrs. Haworth's mills at Ordsall. Other excursions have been arranged, and receptions will be given by the Lord Mayor of Manchester and the Mayor of Salford.

WELL SINKING AND BORING.

MR. JOHN THOM, Canal Works, Patricroft, has for many years devoted his energies to the formation of deep bores and shafts with surprising facility and speed, and in this he has been aided by rock-boring tools and other appliances of his own design and construction. His works at Patricroft are engaged solely in the manufacture and repair of tools for boring and sinking mines and wells.

Mr. Thom has successfully carried through numerous projects, and has recently completed one of the largest bore-holes (7 feet in diameter) in the United Kingdom, and has executed bores for most of the leading civil and mining engineers, colliery companies, breweries, &c., in this country as well as abroad By means of his special tools and machinery exceptionally difficult bores are now possible, and they can be executed at very much less cost than formerly. Various systems of boring are used according to the circumstances of the case. In very hard rock, and when it is important to have samples of the strata through which the bore is made, the diamond drill is used. This is a cylindrical tool which forms the end of a tube made in various diameters. The cutting end of hard steel is studded at close intervals with veritable diamonds, and thus it forms a crown drill, acting very much like the drill which cuts out the bore of an Armstrong gun. It is revolved by an engine and special machinery at the surface, and so cuts its way into the hardest rock. A core of stone rises within the tube, and is brought up whenever the drill is withdrawn. This is effected by an ingenious arrangement within the tube. A steel ring, with a small gap cut out of its periphery, is drawn down to a smaller diameter by a gradual taper inside the tube, and as it descends it closes tightly upon the core, and thus breaks it off. Another system of boring, called the "Canadian," is better suited for soft strata, or for piercing through alternate layers of hard and soft substances. Penetration is done by a hard steel chisel of peculiar form working on the percussion principle, and is operated at the surface by a species of steam hammer and lever, which give about eighty strokes per minute. Acting with a water jet, it quickly reduces the matter to a pulp, and is generally very rapid in its descent.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AT the meeting of Monday the 12th inst., the Council for the year of office 1899-1900 were declared duly elected as follows :—

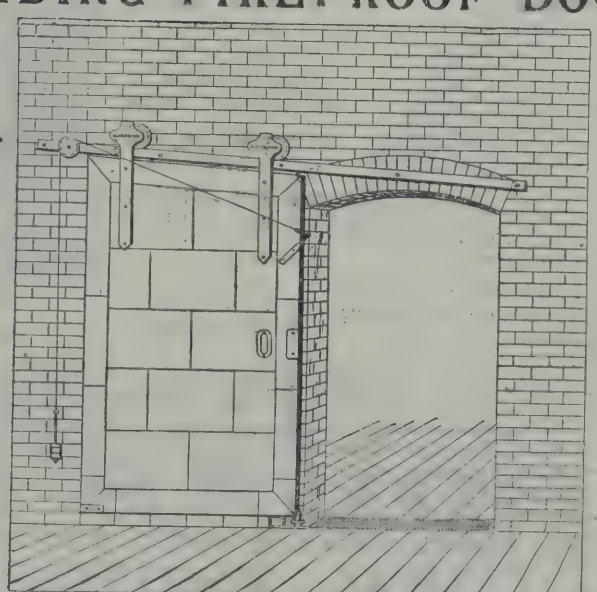
President.—William Emerson.

Vice-Presidents.—John McKean Brydon, W. M. Fawcett, M.A., H. L. Florence, E. A. Gruning.

Hon. Secretary.—Alexander Graham, F.S.A.

Members of Council.—F. T. Baggallay, T. Blashill, James Brooks, J. J. Burnet, A.R.S.A. (Glasgow), W. D. Caröe, M.A., T. E. Collcutt, J. A. Gotch, F.S.A. (Kettering), E. T. Hall, H. T. Hare, E. W. Mountford, Beresford Pite, John Slater, B.A., R. Phenè Spiers, F.S.A., H. H. Statham, Leonard Stokes, Sir John Taylor, K.C.B, Paul Waterhouse, M.A., Aston Webb, A.R.A.

Associate Members of Council.—James Sivewright Gibson, Henry Vaughan Lanchester.



Representatives of Allied Societies.—David Barclay (Glasgow Institute of Architects), R. I. Bennett (Manchester Society of Architects), J. Crocker (Devon and Exeter Architectural Society), T. Drew, R.H.A. (Royal Institute of the Architects of Ireland), R. Evans (Nottingham Architectural Society), C. B. Fowler (Cardiff, South Wales and Monmouthshire Architects' Society), W. Glover (Northern Architectural Association), A. E. Sawday (Leicester and Leicestershire Society of Architects), Joseph Smith (Sheffield Society of Architects).

Representative of the Architectural Association (London).—G. H. Fellowes Prynne.

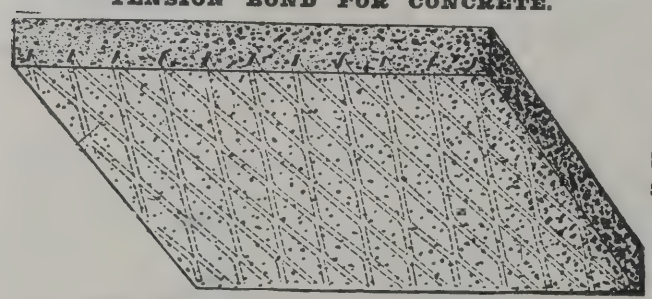
CITY OF LONDON ELECTRIC LIGHTING.

ON Monday Sir Courtenay Boyle sat at the Board of Trade for the purpose of considering the amendments proposed by the City to the provisional order granted to the Charing Cross and Strand Electricity Supply Corporation, Limited, in respect of the City of London. After the inquiry held at Easter, Sir Courtenay Boyle reported to the Board that the order should be granted, but that within two years the company should be required to establish a separate generating station for the purpose of the City undertaking, and that the City Corporation should have power to purchase the City undertaking "at any time after the expiration of a reasonable time to be hereafter settled." The Corporation now suggested that the date of the purchase should be December 31, 1907, and that they should be at liberty to purchase the undertaking at its cost plus 10 per cent., a guarantee being given to the shareholders to make up their dividends in the interim to an average of 4 per cent. per annum. The Corporation also suggested that they should have the right to purchase part only, and not necessarily the whole, of the undertaking in the City, their main object being not to be compelled to purchase the generating station if it were erected outside the City boundary. Sir Courtenay Boyle said he should amend the order by making the date of the purchase 1914, and by giving the Corporation the power of approving the site of the generating station, but in return making it obligatory upon them to buy the generating station wherever situated in the event of their purchasing the City undertaking of the company.

ARCHITECTURAL MUSEUM SCHOOL OF ART.



THE annual general meeting of this Institution was held on the 9th inst. at the museum, Tufton Street, Dean's Yard, Westminster. The president (the Duke of Westminster) was announced to preside, but was detained at the House of Lords, and Mr. J. P. Seddon, a member of the council, took the chair. The report stated that during the year the new classrooms added to the museum on the south side had been completed, furnished and occupied, and had been found extremely useful. The results of the examinations held in 1898 were, on the whole, very satisfactory. In 1897 the number of candidates from the Westminster School of Art who were presented the most advanced subject—drawing from the life—was sixt one, of whom only two failed. It was scarcely to be expecte that this remarkable result could be repeated, but in 1898 the were sixty-four candidates in the same subject, and again on two failed, which showed that the proportion of failures in th subject mentioned was only one in thirty for the school compare with one in four for the whole of the United Kingdom. In th national competition also the work sent up from the School Art was more than usually successful, six students havir obtained prizes, including a gold medal, which was awarded Mr. H. J. Strutt for modelling. Notwithstanding the heav and exceptional expenditure of the last two years, the financ of the Institution were in a satisfactory condition. But 375 of the loan of 500*l.* from the Technical Education Board the London County Council towards the enlargement of th School of Art remained to be paid off. The report and stat ment of accounts were adopted, and on the motion of M J. H. Pollen, seconded by Mr. C. F. Hayward, the Duke Westminster was re-elected president of the Institution for th ensuing year. The vice-presidents were also re-elected, wit the addition of the name of Sir A. Blomfield, A.R.A. Th council were next reappointed, after which Sir Wyke Baylis president of the Royal Society of British Artists, read a pape entitled "The Bogey in the Studio: an Address to A Students on the Questions of the Day." The hall was we filled by students, and at the conclusion of the address cordial vote of thanks was passed to the lecturer on the motio of Mr. Aston Webb, A.R.A.

CONTINENTAL TRAMWAYS.

A REPORT has been prepared by the tramways committee of th Brighton Corporation on various tramways in this country an on the Continent.

Rouen, it is pointed out, is essentially a commercial city and can in no sense be compared with Brighton. It is explaine that steep gradients are frequent, and the steepest is 1 i 13. There are many sharp curves, the sharpest having radius of 45 feet, while the others vary from that to 60 fee The whole of the tramways are worked on the overhead wir or trolley system; the work was finished and the lines opene in February 1896. The work was carried out by the Frenc

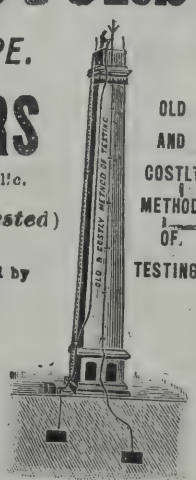
Thomson-Houston Company upon the usual American methods, but with sundry improvements in detail. Up to February 1896 there were about 15½ miles of single tramways worked by horses, but these were converted to the electric system, and new routes added, making a total of 27 miles. The gauge was 4 feet 8½ inches, and most of the routes are single lines and often laid on one side of the road and not in the centre. Fifty poles per mile was the usual quantity estimated for, and they were placed, as near as circumstances permitted, about 40 yards apart. The cost of the system in Rouen is said to have been from 1,300*l.* to 2,000*l.* per mile, about one-third of the line being double track and two-thirds single track. The electric lighting is in the hands of a separate company, therefore the tramway company built and work their own power station. The company is in possession of seventy-five cars and 34 trailers, and some of the former, which are two-deckers, carry fifty passengers. In 1895 the number of fares was 5,162,096, receipts 897,642 francs, and the expenses 738,040 francs, while the corresponding figures of 1898 were 15,096,042, 1,792,053 francs, and 1,063,444 francs respectively. The receipts for fares were equal to 8*d.* per car mile. In the year 1898 the company had a capital of 10,000,000 francs, which has since been increased to 12,000,000 francs (180,000*l.*). The net profits of the company during the year ended December 31, 1898, amounted to 670,448 francs (26,800*l.*), and enabled them to pay a dividend of 4*l.* per cent. There is no doubt, says the report, that the overhead system as adopted and worked at Rouen is, from a commercial point of view, very efficient and successful.



In Paris there is a very extensive system of tramways. Horse tramways prevail very generally, and are owned by three large companies. There are, too, three systems of steam tramways, namely, the ordinary locomotive, the fireless and the "Serpollent" tube boilers. There is also a cable and one line worked by compressed air. The electric systems were the accumulator, the open conduit, the surface contact and the overhead trolley wire system. With regard to the cable, it was laid in a poor district, and was constructed by the Municipality of Paris, and afterwards leased to a company, by whom it was being worked. The line cost 52,000*l.* and was leased for 2,000*l.* per annum, its capital being 80,000*l.* Its length was about 1¼ miles single line, and the receipts for 1898 were 18,633*l.* 12*s.* 6*d.* The line is a profitable one, paying 14 per cent. on the capital. There are about 9 miles of line worked on the compressed air car system, the heavy gradients being 1 in 13, 1 in 25 and 1 in 37. The company pays a dividend of 3½ per cent. The accumulator cars run a length of 6¾ miles, and the worst gradient is 1 in 27, the speed on which does not exceed 2 miles per hour, and the system did not seem suited to steep gradients. It was said that 5½*d.* per mile covered the working expenses, inclusive of maintenance of road and interest on capital. As to the underground conduit system and overhead trolley wire on the Clarenton line, the committee were unanimously of opinion that it was the best form of overhead work they had seen. The length of the line was about 3¾ miles of double track. The system was very good, but is nearly double the cost of the overhead trolley wire system. The surface contact system already covers 4½ miles, and 10 miles are in course of construction. The line is undulating, but practically a continuous rising gradient, the steepest being 1 in 16½, 1 in 18, and 1 in 21. The cost of working is 1*d.* per mile, and repairs to cars, permanent way, rather more than ¾*d.* The total receipts for 1898 were about 31,750*l.*, and the expenditure about 23,075*l.*

In Brussels there are four systems of tramways—electric overhead trolley wire, electric underground conduit, steam and horses. Accumulator cars have been tried and abandoned. The total length of all the tramways is about 50 miles, and they are worked by various companies, but will revert to the local authorities at the expiration of the term of years of which they have been granted. The most important company is the National Company of Local Railways. All the lines partake largely of the character of light railways, and the cost of construction averaged 1,222*l.* per mile. In the system of the Brussels Tramways Company there are 34 miles, worked partly by horses and partly by electricity, the latter section consisting of five lines having a total of 17 miles of double track and 1½ miles of single track. On the electric lines considerable gradients are encountered, the steepest being 1 in 10. The cost of constructing the underground conduit lines was about 19,600*l.* per mile of double track, including everything, and of overhead lines 5,410*l.* per mile inclusive.

At Boulogne there is only one system, the overhead trolley wire, 2½ miles in extent. There are some sharp curves and steep gradients, the steepest being one in nine, which is the same as that of Church Hill, Dyke Road, but the length of the hill is nearly double that of Church Hill. Owing to the steep gradients special precautions have been taken to keep the cars well under control in case of emergencies. As the line has not yet been in operation for one year, the financial results cannot yet be given. There are 3¾ miles of electric tramways.

THE SANITARY INSTITUTE.

THE preliminary programme of the eighteenth Congress, to be held in Southampton from August 29 to September 2, has now been issued. The president of the Congress is Sir W. H. Preece, K.C.B., F.R.S., Pres.Inst.C.E.

Mr. Malcolm Morris, F.R.C.S. Edin., M.R.C.S. Eng., will deliver the lecture to the Congress, and Bailie J. Dick, J.P., chairman of the health committee, Glasgow, will deliver the popular lecture.

Excursions to places of interest in connection with sanitation will be arranged for those attending the Congress. A conversazione will be given by the mayor (Councillor G. A. E. Hussey).

It appears from the programme that over 300 authorities, including several county councils, have already appointed delegates to the Congress, and as there are also over 2,200 members and associates in the Institute, there will probably be a large attendance in addition to the local members of the Congress.

In connection with the Congress a health exhibition of apparatus and appliances relating to health and domestic use will be held as a practical illustration of the application and carrying out of the principles and methods discussed at the meetings. It not only serves this purpose, but also an important one in diffusing sanitary knowledge among a large class who do not attend the other meetings of the Congress.

The Congress will include three general addresses and lectures. Three sections meeting for two days each, dealing with (1) sanitary science and preventive medicine, presided over by Sir Joseph Ewart, M.D., F.R.C.P., J.P.; (2) engineering and architecture, presided over by James Lemon, M.Inst.C.E., F.R.I.B.A.; (3) physics, chemistry and biology, presided over by Professor Percy F. Frankland, Ph.D., B.Sc., F.R.S. Eight special conferences—Municipal representatives, presided over by Alderman T. Walton, J.P., chairman of the health committee, Southampton; port sanitary authorities, Millar Wilkinson, chairman Port of London Sanitary Authority; medical officers of health, presided over by T. Orme Dudfield, M.D., L.R.C.P., M.R.C.S.; medical officers of schools, C. G. Shelly, M.A., M.D.; engineers and surveyors to county and other sanitary authorities, presided over by E. Purnell Hooley, Assoc.M.Inst.C.E.; veterinary inspectors, W. Hunting, F.R.C.V.S.; sanitary inspectors, presided over by C. MacMahon, chief sanitary inspector, Torquay; domestic hygiene, presided over by Mrs. Patey.

The local arrangements are in the hands of an influential local committee, presided over by the Mayor of Southampton, with A. Wellesley Harris, M.R.C.S., D.P.H.; W. B. G. Bennett, Assoc.M.Inst.C.E.; W. Matthews, M.Inst.C.E., and C. H. Russell, M.R.C.S., D.P.H., as honorary secretaries.

METROPOLITAN IMPROVEMENTS.

THE improvements committee of the London County Council, of which Mr. Shaw Lefevre is chairman, have submitted to the Council the annual list of county improvements in respect of which they recommend that Parliamentary powers should be sought next session. The list contains six improvements, several of which are important.

The first relates to the extension of the Thames Embankment between the Houses of Parliament and Lambeth Bridge and the improvement of the district near Millbank. It is proposed that the course of Abingdon Street and Millbank Street shall be altered, that the new street 70 feet wide shall start from a point which will involve the demolition of the corner house of Old Palace Yard and run thence diagonally to a point much nearer the end of Lambeth Bridge than at present. It is proposed further to purchase all the property between this line and the river on the one side and between it and the west of St. John's Church on the other side, to lay out the land between Millbank Street and the river as an addition to the Victoria Tower Garden, and to lay out in a manner suitable for offices and residential houses and with widened streets the land between Millbank Street and St. John's Church. By the recoupment resulting from the alteration of the line of Millbank Street and from the acquisition of the property between the street and St. John's Church it will, in the opinion of the committee, be possible to effect this great improvement—to embank the river, to lay out the garden, to widen Millbank Street and to widen the other streets up to St. John's Church, including a portion of Horseferry Road—at a cost of 530,000*l.*, as compared with 306,000*l.* for the imperfect and unsatisfactory scheme of merely widening the existing Millbank Street, and 498,000*l.* for both widening and straightening the street. This estimate of 530,000*l.* does not include the cost of altering the Abingdon Street block. This, the committee point out, is not absolutely essential to the main part of the scheme. It would be a great public improvement in itself and greatly improve the approach to the Victoria Tower and the Houses of Parliament, but in their opinion it is a matter which concerns

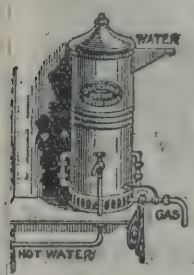
the Government more than the Council. If carried out by the Council, it is estimated that the net cost would be 130,300*l.* The committee propose, therefore, to leave this part of the scheme to be undertaken by the Government and to confine their specific proposals to the widening of Millbank Street and the embanking of the river. It is estimated that the purchase of property would involve an expenditure of 1,329,000*l.* and the value of the recoupment would be 873,000*l.*, leaving the net cost 456,000*l.*, to which must be added about 74,000*l.* for the cost of the works, making a total of 530,000*l.* With regard to the question of contributions, the committee think that the Westminster Vestry should contribute not less than 100,000*l.* They accordingly recommend the Council to sanction application being made to Parliament for power to carry out the scheme, subject to the Government's agreeing to undertake the Abingdon Street portion of the scheme and to a contribution of 100,000*l.* from the Westminster Vestry. The cost of rehousing the persons who would be displaced by this scheme is estimated at 50,000*l.* There is no suggestion for an extensive levying of an improvement charge.

The second scheme is for the widening of Mare Street, Hackney, to 70 feet between the North London Railway and the Triangle. The total net cost of this scheme is 577,100*l.*, and it is recommended subject to a contribution from the Hackney Vestry of not more than 125,000*l.* The vestry have already offered to contribute this sum. The third scheme proposes to widen Goswell Road to 60 feet between Upper Ashby Street and Great Sutton Street at a net cost of 209,500*l.* It is only to be undertaken if the vestries of St. Luke and Clerkenwell contribute between them the sum of 20,000*l.* towards the cost. The fourth improvement is a widening of Nine Elms Lane to a maximum of 60 feet between Southampton Street West and Battersea Park Road. The net cost of this scheme is 136,400*l.*, to which the Battersea Vestry are to contribute 15,000*l.* The fifth project deals with the Camberwell New Road, which is to be widened between Warner Road and Camberwell Green at a net cost of 52,000*l.*, towards which the Camberwell Vestry are to contribute 5,000*l.* The last improvement is a small widening in the Kentish Town Road.

The estimated net cost of these six improvements, without deducting contributions, is 1,565,000*l.*; after deducting contributions, 1,297,000*l.* If carried out the annual charge involved thereby on the rates for interest on and repayment of debt, calculated on the net cost, would be 57,665*l.*, which is equivalent to a rate of ·374*d.* in the pound.

THE LAW OF TRADE-MARKS.*



THE subject of "Trade-marks" is not by any means a new one to this Society, and in bringing it once more before the notice of the members I do so with feelings of considerable diffidence, well knowing that the subject has been most ably and exhaustively treated on a number of previous occasions, notably by Sir Henry Trueman Wood some twenty-five years ago, and by Mr. Edmund Johnson in 1881, and by other well-known authorities. At the same time I cannot disguise from myself the fact that when these gentlemen dealt with the subject they did so under conditions differing very widely from those which prevail at the present time. The first-named gentleman read his paper when the first Act was, so to speak, in the chrysalis state, and the latter after some five years' experience of its working. Since that date the subject, and also the commercial value of trade-marks, have advanced to an enormous extent, and it is now felt by the great bulk of the manufacturers and merchants of this country—owners of trade-marks—that some amendment of the existing law is absolutely necessary if the trade of the country is not to be curbed and weighed down by vexatious restrictions, which may possibly at one time have been advisable and salutary, but have now, by the expansion of trade methods and foreign competition, become irksome and dangerous.

It is for this reason that I have thought it advisable to bring the matter once more prominently before this Society, in the hope that some assistance may be forthcoming to further the scheme for an amending Act, which, as a matter of fact, the London Chamber of Commerce, after very mature consideration, has decided to promote, and I do not think it would be outside the scope of this Society's work were it to form a committee to gather and put into form the views and requirements of the trading community on this subject.

I do not think that I am exaggerating when I say that for years past the practice which has prevailed at the Patent Office relating to word marks has been one in which confusion has predominated to an enormous extent, and this state of affairs has arisen from an apparent inability to arrive at anything like a consistent or logical definition of the subsection of the Act as to what constitutes a "word trade-mark."

The decisions in the Law Courts have been so conflicting that it would be somewhat surprising if the officials at the

Patent Office had been able to adopt any consistent line or theory upon which to act when dealing with the applications before them. This fact does not, however, entirely or satisfactorily explain many of the decisions of the Comptroller-General, and I think you will agree with me that this is so when I say that it is within my own knowledge that when a few months ago an application was made to register the word "Jessamine" for soap, this application was refused on the ground that it was a geographical term. The attention of the learned Registrar was drawn to the fact that the Court of Appeal had recently decided that the word "Magnolia" was not a geographical term within the meaning of the Act, notwithstanding that there are a number of places called "Magnolia." The Registrar, acting for the Comptroller, refused, however, to follow the ruling of the Court of Appeal, and refused the application for the word "Jessamine." Within a few weeks a similar application for the registration of the same word "Jessamine" was made by another firm for tobacco, and on this occasion the mark was accepted and registered. I do not profess to say whether or no the word is a word capable of registration under the provisions of the present Act, but I do submit that the Registrar was absolutely wrong in at least one of his decisions in dealing with this word. On the question as to whether such a word should be protected there ought to be no doubt, and the statute should be plain enough to make such a point quite clear.

Looking back we find that until 1875 there was no statute law regulating or providing for the special protection of trade-marks, and up to that date trade-mark owners had perforce to rely on the common law for any protection they might require against fraudulent infringements.

I think I may fairly say that for some thirty-five years or thereabouts, before the passing of the first Act, the Courts had recognised the right of property in, and exercised their authority to grant injunctions against, the wrongful use of trade-marks. The first leading case on this point is that of Millington *v.* Fox, in which Lord Cottenham decided that the defendant could be restrained, notwithstanding that the infringement might have been due to ignorance, fraud being entirely absent. This, so far as I am aware, is the first case in which actual vested property in a trade-mark is recognised, and it is quite clear that since that date this right has never been disputed. Neither will it, I think, be disputed that it was from the establishment of this right and from the subsequent varying decisions in the Courts there arose the imperative necessity for an enactment for the purpose of more clearly defining such rights and for the establishment of a register or record of ownership. This resulted in the Act of 1875, which provides, *inter alia*, that a trade-mark must be registered for a particular class of goods, and that registration as first proprietor is *primâ facie* evidence of the right to the exclusive use of such trade-mark against all comers, and that undisturbed possession for five years is conclusive evidence of the right to a sole property in the said mark.

A trade-mark is defined in the Act as follows:—

"For the purpose of this Act a trade-mark consists of one or more of the following essential particulars, that is to say—

"A name of an individual or firm printed, impressed, or woven in some particular and distinctive manner; or

"A written signature or copy of a written signature of an individual or firm; or

"A distinctive device, mark, heading, label, or ticket;

—and there may be added to any one or more of the said particulars any letters, words, or figures, or combination of letters, words, or figures; also,

"Any special and distinctive word or words, or combination of figures or letters used as a trade-mark before the passing of this Act may be registered as such under this Act."

The Registry was opened on January 1, 1876, under the able management of Mr. (now Sir) H. Reader Lack. The classification of merchandise under fifty heads at that time adopted still remains in force, notwithstanding that it has repeatedly been shown how necessary it is that, in many respects, this classification should be altered; for instance, a manufacturer dealing only in soap must register his mark in, at least, four different classes if he desire to have the sole use of such mark for soap.

The Act of 1875 was followed by an unimportant amending Act in 1877, but it was not until 1883 that any further legislation took place, although, as was speedily discovered, the Act of 1875 contained one great defect, in that it did not provide for the registration or protection of word marks other than those which had been in actual use before August 13, 1875. The greatest dissatisfaction resulted from this, and various tactics were adopted by applicants for the registration of new word marks. In many cases it was alleged, contrary to the fact, that the marks had been in use before the passing of the Act; in other cases trivial designs were added to the word and registration obtained for the word in conjunction with such designs which it was not intended to use. This unsatisfactory state of

5 ft. 8 in. × 3 ft. 4 in.	

Sizes given are under head to under sill and between pulley stiles.
Fitted with Deal Sills and Iron Axle Pulleys.

NET PRICES AT WORKS, BIRMINGHAM.

THE LARGEST MANUFACTURERS OF WOOD CHIMNEYPIECES IN THE KINGDOM

Established over 20 Years.

affairs existed until 1883, when a new definition of a trade-mark was adopted, as will be seen from a perusal of section 64 of the 1883 Act :—

1. "For the purposes of this Act a trade-mark must consist of or contain at least one of the following essential particulars :—(*a*) A name of an individual or firm printed, impressed or woven in some particular and distinctive manner ; or (*b*) a written signature or copy of a written signature of the individual or firm applying for registration thereof as a trade-mark ; or (3) a distinctive mark, brand, heading, label, ticket, or fancy word or words not in use.

2. "There may be added to any one or more of these particulars, any letters, words or figures or combination of letters, words or figures, or of any of them.

3. "Provided that any special and distinctive word or words, letter, figure or combination of letters or figures, or of letters and figures used as a trade-mark before August 13, 1875, may be registered as a trade-mark under this part of this Act."

Thus to the clamour from all quarters for some right to register and obtain protection for word marks, the Legislature made the concession that an applicant could register—"a fancy word not in common use"

If the framers of this definition of a trade-mark had with intent determined to use a word which must necessarily lead to litigation, they could not have adopted a better word for their purpose than "fancy." What is a fancy word? There was nothing in the Act to indicate what was meant by the term, and nothing whatever to guide those who were interested in knowing. The word, according to the dictionary, has twenty meanings, but not one of these various meanings relates to words. I fancy a lawyer was at the bottom of that sub-section, and he must have fancied, and rightly too, that a fruitful crop of law suits would result, for such was the case. Many definitions of "a fancy word not in common use" were given, and one of the clearest is that of Lord Justice Lopes, who laid it down that the following conditions were necessary in order that a word should come within the meaning of the term :—

"It must be obviously meaningless as applied to the article in question ; it must be fanciful in its application to the article to which it is applied, in the sense of being so obviously and notoriously inappropriate as to be neither deceptive nor descriptive, nor calculated to suggest deception or description ; and, further, it must have an innate and inherent character of fancifulness, which must not depend on evidence, and cannot be supported by evidence to show, that in fact it is neither deceptive nor descriptive, or calculated to be deceptive or descriptive."

Amongst the words which the Courts decided did not comply with this condition, and consequently were not fancy words, are :—"John Bull" for beer ; "Sanitas," disinfectants ; "Hand Grenade," fire extinguishers; "Gem," guns; "Rokoko," cotton goods ; "Compactum," umbrellas ; "Carnival," cigarettes ; "Melrose," hair restorer ; "Tower," tea ; "Emollio," toilet cream ; whilst amongst those words which have been held to be fancy words and capable of registration are :—"Oomoo," wine ; "Alpine," embroidery, afterwards reversed ; "Bovril," preparation of beef.

Take the last as an example. Does the word "Bovril" fall within Lord Justice Lopes's definition of the term fancy word ? I cannot think it does, and when we remember that such words as "Invincible" for lawn mowers ; "Perfect," furniture ; "Fir Tree Oil," insecticides ; "Japanese," blacklead ; "Walkinease," boots ; "Standard," oil wicks ; "National," boots ; "Artisan," stoves ; "Siveroid," metallic alloy ; "Tip-top," pipes ; "Domestic," tea ; "The Vets," horse powders ; "The Club," matches ; "Universal," kneading machines ; "Reliance," soap ; "Perfection," soap ; and hundreds of others of a similar nature were registered without protest at the Patent Office, it is clear that there was something wrong somewhere, for these marks certainly do not fall within the definition of Lord Justice Lopes. There are to-day numbers of word marks on the register that do not nearly comply with the precedent conditions as defined by the Courts, and the owners of hundreds of such marks are undoubtedly living in a fool's paradise, from which they may emerge with the inevitable notice of motion to rectify the register. The hardship which is entailed by this condition of things is apparent when we consider that a man may without any objection at the Patent Office register a trade-mark, spend thousands of pounds on making it known far and wide, only to find that the Courts willl expunge the same from the register and deprive the owner of any rights he may have possessed or fancied he possessed.

The restrictions placed upon the registration of word marks by the cramped definition of a "fancy word" rendered it almost impossible to obtain word marks at all, or having obtained them, to be at all sure that the Courts would regard them with any respect or allow them to remain on the register. This resulted in a renewed agitation for fresh legislation of a nature which would widen the definition of a trade-mark, so as to meet the well-known requirements of commerce.

'KOH-I-NOOR" TRACING CLOTH IS MADE TO USE.
IS THE FINEST PRODUCT EVER PUT ON THE MARKET.
IT IS PRODUCED ON HONOR
IS NOT CHEAP IN PRICE
IS WORTH THE MONEY
AND WILL BE APPRECIATED BY EVERY ARCHITECT AND DRAUGHTSMAN. Ask for Sample.
Made by L. & C. HARDTMUTH, 12 GOLDEN LANE, LONDON, E.C., the Makers of the famous "Koh-i-noor" Pencil.

In response to this agitation, Parliament, in the Act of 1888, substituted for "fancy word" or words not in common words, or (*e*) a word or words having no reference to the charac- "use," the following:—(*d*) "An invented word or invented ter or quality of the goods and not being a geographical name."

It is quite certain that the Legislature intended a much wider and more liberal construction to be placed on the provision of the Act of 1883 than the Law Courts thought advisable, and the very restrictive and almost prohibitive construction adopted by the Courts had a disappointing and exasperating effect on the trading community, which was thus hampered and absolutely injured in business. This feeling was to a great extent removed when the Act of 1888 came into force, and it was felt by those most interested that "the morning of our discontent" was gone, and this, no doubt, would have been so, and the trade-mark owners of this country would have secured that which the Legislature most certainly intended them to have if the Courts had adopted a more liberal and reasonable construction of the new terms. Instead of doing so, however, they followed the same course with reference to the provisions of the Act of 1888 as they had previously adopted towards the provisions of the Act of 1883, and placed the most restrictive and at the same time inconsistent construction on the new terms. This caused, as was natural, a feeling of renewed irritation within the commercial community, while the then existing muddle has become a more bewildering maze of contradictions and absurdities, and the demand for a new Bill, such as that which is promoted by the London Chamber of Commerce, will, I am sure, be regarded by all reasonable men as well founded and justified in the highest degree.

Having thus briefly dealt with the history of the subject up to this date, I will endeavour to deal with some of the points which I think call for attention.

In the first place, I think it would be to the advantage of all concerned if the Trade-marks Office were separated from the Patent Office, with the Registrar as sole responsible chief. This would not involve a removal from the present premises, but would enable applicants and their representatives to present their arguments at hearings to the head of the department, instead of, as is now the practice, to the second in command, viz. the Registrar, who, when he is in doubt, terminates the hearing by saying that he will consult the Comptroller, and from the invariable results of such consultations it is reasonable to suppose that the views of the Registrar, rather than those of the applicant, are most prominently presented to the Comptroller.

Further, in an appeal from the decision of the Comptroller, which some few months ago was before the Court of Appeal, the Attorney-General repudiated the statement that the Comptroller had done such and such a thing, asserting that it was the Registrar who had done so, notwithstanding that all the documents bore at the foot the name of the Comptroller. That is, to say the least of it, unsatisfactory, and I submit that there is no occasion for a "buffer state" between the applicant and the head of the Trade-marks Office. For this reason I suggest that the next Act should deal fully with the subject of trade-marks alone, and should repeal all that portion of the Acts 1883-88 dealing with trade-marks, and I would point out that this necessary alteration would not involve one shilling additional cost.

(*To be concluded.*)

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

APPLICATIONS FOR PATENTS.

11142. Herbert Alexander and John Holding, for "An improved mould for brickmaking and such like purposes."

11182. August Rincklake, for "Improvements in the construction of ceilings and walls."

11214. George Clarke, Joseph Clarke and Mark Clarke, for "Improvements in the manufacture of bricks and in machinery therefor."

11237. William Caplen and Frederick Caplin, for "Improvements in apparatus for rubbing bricks and the like."

11256. Theophile Edouard Ayotte and Arthur Albert Charboneau, for "Improvements in machines for the manufacture of bricks."

11270. Alfred Grayson and William James Spratley, for "A new or improved brick for building and other purposes."

The Architect.

THE WEEK.

ON Tuesday morning a number of passengers left Belfast on what promises to be a most interesting tour for archæologists. That the Irish and Cambrian Societies are united in it suggests the broad way in which investigations are now conducted. The excursion will continue until the 29th inst., and in the course of the ten days the islands on the west and northern coast of Scotland will be visited. An interesting guide has been prepared by Mr. ROBERT COCHRANE describing Sanda, Kildalton, where there are crosses resembling those found in Irish churchyards, Colonsay and Oronsay, Iona, Tirce, Coll, Canna, Skye, the outer Hebrides, the Flannan Isles, North Rona, Orkney, Kirkwall, Caithness and other interesting places. If the weather continues to be favourable the excursion should be a success, and, as far as can be judged by the programme, it has been organised so as to make the whole time profitable. For Irish members who may not care to go so far there will be another excursion started on June 28, in which the north coast of Antrim and the battlefield of the Boyne, the tumuli of Dowth and Newgrange, Mellifont Abbey and the round tower at Monasterboice will be visited.

THE death on the 14th inst. of the last surviving son of Sir MARTIN ARCHER SHEE unites the present with the past in a remarkable way. The father was born in Dublin in 1769. He was therefore only a year younger than the Royal Academy, over which he was destined to preside for twenty years. SHEE came to London in 1788, and it was on the introduction of EDMUND BURKE he became acquainted with REYNOLDS, and was admitted to the schools of the Academy. With many of the celebrities of the time which followed he was a friend. His social and other gifts pointed him out as an eligible President. For he did not confine himself to painting. He wrote a long poem, a tragedy, for which he received 500*l.*, a three-volume novel, and attempted prose and verse in other forms. When, in 1830, he was selected to fill the President's chair, he had been thirty years an Academician. At the Parliamentary inquiry in 1836, to which there was reference a few nights ago in the House of Lords, SHEE was the principal witness. The triumph of the Academy at that time was mainly owing to his tact and knowledge. It is possible his success made him appear as an official partisan, for he did not obtain the commissions he had some right to expect. Moreover, he was generous, and at a no small sacrifice upheld the dignity of his office by lavish hospitality. The President was compelled to accept an allowance of 300*l.* a year from the Academy, with 200*l.* a year from the Crown. But he did not long enjoy the money, for he died in 1850. The lives of father and son comprise a period of 130 years, in which many revolutions were accomplished in art as in other affairs.

WE referred last week to the dispute between the heritors of St. Leonard's Church and the Presbytery of St. Andrews, the question at issue being whether the church should be rebuilt as proposed by the latter, or repaired as the heritors desire. The subject has been since considered by the Presbytery, and a formal order was issued directing the heritors to take immediate steps to provide a church suited to the times and capable of affording comfortable accommodation for two-thirds of the number of examinable persons, *i.e.* for 480 persons, and the heritors were also ordered to lay plans and specifications for such a church on such a site as they may deem most appropriate before a meeting of the Presbytery to be held in St. Andrews on the first Wednesday in September. An amendment was proposed in favour of repairing, but it received little support. An appeal has been lodged, and apparently a stiff contest must be gone through before a settlement can be arranged, and the question is, Who will pay the inevitable expenses?

MANSIONS with a history in the neighbourhood of London are not always sure of attracting generous biddings in the auction rooms. On Tuesday the excellent house at Hampstead known by the modest title of Branch Hill Lodge, and which is on the way from Holly Bush Hill to the Heath, was put up for sale, and as the highest bidding was 23,500*l.* the property was bought in. The mansion is not all of one time. It was in 1745 that Sir THOMAS CLARK, the Master of the Rolls, who then owned it, began additions. A former proprietor was Lord LOUGHBOROUGH, who afterwards owned Rosslyn House, and who seems to have found delight in altering houses. It is, therefore, difficult to say what is the oldest part of Branch Hill Lodge. Lawyers are not usually grateful or generous, but Sir THOMAS CLARK left the lodge to Lord Chancellor MACCLESFIELD, who had befriended him. It was necessary, however, for the new owner to purchase a part which was copyhold and which was considered to be outside the terms of the will. Afterwards it passed to another lawyer, THOMAS WALKER, a Master in Chancery. A son of Sir RICHARD NEAVE purchased it in 1799, and he enriched it with a collection of painted glass which was supposed to be the most important in any private house. It is to be hoped the house will be preserved as a residence, but judges and wealthy lawyers in our time are not as fascinated with Hampstead as WEDDERBURN, ARDEN, ERSKINE, BETHELL and others.

THE Council of the Society of Arts have awarded the Society's silver medal to the following readers of papers during the session 1898-99:—Professor GEORGE FORBES, F.R.S., for his paper on "Long Distance Transmission of Electric Power"; Mr. C. H. BOTHAMLEY, F.C.S., "Photographic Developers and Development"; Mr. DIXON H. DAVIES, "The Cost of Municipal Enterprise"; Mr. JAMES SWINBURNE, "Nernst's Electric Lamp"; Mr. J. H. COLLINS, "Cornish Mines and Miners"; Mr. PHILIP DAWSON, "Electric Traction"; Mr. WALTER HUNTER, M.Inst.C.E., "London's Water Supply"; Sir WILLIAM HENRY PREECE, F.R.S., "Ætheric Telegraphy"; Colonel RICHARD CARNAC TEMPLE, C.I.E., "The Penal System at the Andamans"; Sir JOHN SCOTT, "Judicial Reforms in Egypt"; Mr. ARCHIBALD LITTLE, F.R.G.S., "The Yang-tse Basin and the British Sphere"; Mr. STEPHEN WEBB, "Intarsia, or Inlaying"; Mr. J. STARKIE GARDNER, F.G.S., "The Revival of Tradesmen's Signs."

IT is possible to make stuff which will have the appearance if not the qualities of mortar without going to much expense for lime and sand, but the mortar which is said to be lately employed in Bootle is of so extraordinary a character that we might easily imagine the witnesses were using figurative language. The building inspector of the town a few days ago stated that on the 9th inst., as he was passing some houses and shops which were in course of erection, he was struck by the offensive smell. He examined the mortar, and it did not appear to correspond with the requirements of the by-laws. He spoke to the builder, Mr. GRIFFITH PRICE, who, we learn, informed the inspector that the bricklayers employed had removed pieces of flesh and skin from the mortar. Hair is a common enough ingredient, but why the skin and flesh should be introduced does not appear reasonable. The inspector then submitted a sample of the mortar to the borough surveyor, and he confirmed the conclusion that it did not comply with the by-law. The official examination did not detect fragments of flesh or skin, but there was a substance resembling wool. The conclusion was drawn that the mortar must have been partly made in a tanyard. The organic matter being in an offensive state, a bad odour from it was not remarkable. Mr. PRICE, the builder, was not present at the early part of the proceedings, but when he appeared he denied some of the statements attributed to him and applied for an adjournment. The second day's inquiry did not help the builder, for even the bricklayers admitted the mortar was inodorous. A chemist said it would require three days to make an adequate analysis. The chairman said there was a breach of the by-laws, and fined the builder 3*l.* with 3*l.* 3*s.* costs, adding that if it were not the first case the maximum penalty would have been inflicted.

THE ASSOCIATION SKETCH-BOOK.

THE third volume of the third series of the Architectural Association Sketch-Book, which is edited by Mr. WILLIAM G. B. LEWIS and Mr. W. A. PITE, surpasses its predecessors by its title-page. The design is by Mr. OSMOND M. PITTMAN, and represents two graceful girls contemplating a model of a circular temple or tabernacle, which one of them appears ready to kiss. Outline is mainly relied on, and variety depends on bands of black relieved by ornament in white. At the sides and foot a modern fashion in ornamentation is exemplified by long stalky plants which are without leaves. With such a drawing in front expectation is raised, and the ordinary plates of architectural subjects are likely to be judged with more rigour than is usual.

Seventy-two plates are given. Thirty-four are of English subjects, six are Welsh, and six are from Scotland. There are only two subjects taken from France, five from Belgium, one from Germany, seventeen from Italy, and one from Spain. The attention given to Italian work would appear to suggest the growth of the belief that details from that country can be assimilated with English work, whether original or otherwise.

The series commences with a drawing of the plaster ceiling in the bedroom, Aston Hall, which was occupied by CHARLES I. for a couple of nights before the Battle of Edgehill. The ceiling is divided into curved and rectilinear compartments, and within each is ornament that apparently was derived from metalwork. The drawing is by Messrs. R. S. DODS and HEATON COMYN, and is careful if timid. Mr. E. HOWLEY SIM gives three plates of the "Church of St. Kyneburga, Northampton." It embodies the changes of form which appeared between A.D. 1124 and 1500, and each variation happens to be in good style. About the interest of the building there can be no question. The drawing is firmly lined, but the dimensions are not always in clear figures. We draw attention to this drawback, for arrangements could easily be made by the committee to insure legibility, and in that way the character of the drawings would be improved. The "Pulpit, St. Nicholas Church, Deptford," of which Mr. COMYN supplies a drawing, is an ingenious example. The pulpit is hexagonal on plan, and the projecting front, which is about three feet beyond the upright, appears to be carried by a boy who is transfixed by a big iron bolt, and, if he did not serve as a figure-head for a small vessel, must be the work of a ship's carver. Part of the drawing is carelessly ruled, and the reproduction is unsatisfactory. A screen from Dunster Church and another in Trent Church, by Mr. W. HAYWOOD, suggest the richness of the Somersetshire interiors at the close of the fifteenth century. In the former there is an indication of the coming Renaissance in the detail, and it does not clash with the Classic tomb beyond; while in the latter we see fan vaulting, a large window and elaborate bench ends rather than a screen. The sketches recall Mr. RAILTON'S work. The "Wrought-iron Railing, Ormeley Lodge, Ham Common," by Mr. COMYN, shows an example of a screen about 50 feet long, very light and unpretentious, but which would be improved by more thickness in the upper flat bar. The "Booth Porch, Hereford Cathedral," is early sixteenth-century work, and is shown on an excellent drawing by Mr. J. A. K. INGLIS, who knows the value of uniformity in his lines.

The "Pilgrim's Chapel, Houghton-le-Dale, Norfolk," measures only 28 feet 6 inches within, but it merited the five plates which Mr. HOWLEY SIM occupies with the building. It dates from 1350, and has, of course, suffered in many ways. But enough is left to suggest that originally much care was exercised over all the details. Flint was largely used, and became effective by the varieties employed and the contrast with dressed masonry. The "Staircase at No. 54 Great Marlborough Street, W.," is a fine specimen of eighteenth-century joinery and carving. The balusters are delicate enough to tempt mischievous boys, but they appear to be uninjured. It is carefully drawn by Mr. COMYN, who also represents a veneered cabinet of the same period and of rather novel design. "Old Moreton Hall, Cheshire," has been more often drawn than any other building of its class, although the designer could not have believed in the wisdom of the old saying, "Rien de trop," for the wood is in excess. Mr. MAXWELL AYRTON gives two plates of the exterior. A characteristic Jacobean staircase from Ockwells Manor, Maidenhead, is the subject of Mr. H. C. PULLEN'S plate.

The best examples of measured drawings in the volume are those by which the "Chantry of Abbot Ramryge, St. Albans Cathedral," is delineated, and which were produced by Mr. C. DE GRUCHY. Three of them are of double size, and the detail is rendered with a care that testifies to the interest taken in the subject. Ruled and freehand drawing and lettering are alike praiseworthy, and the four drawings should be hung in any classroom where architecture is taught, as examples in their special class. Mr. DARE CLAPHAM has two examples of the "Panelled Room from Sizergh Castle, Westmoreland," which is now in the South Kensington Museum. The panels are inlaid with holly and bog oak, and the refined character of much of the ornament reveals the presence of an Italian artist in the North. From the same hand is a plate of "The Banqueting House or Concert Room, Kensington Palace." Mr. J. A. SWAN gives geometrical drawings of a window, sedilia and piscina from Temple Balsall Church, Warwickshire. The date is said to be A.D. 1260, and therefore about half a century prior to the downfall of the Templars. It would be interesting to learn whether the rather numerous heads introduced among the foliage and as stops to arch-moulds are portraits of members. Mr. HAYWOOD has taken three drawings from Wells Cathedral. One is the north porch, which was plotted in pencil, the sections being in ink. There is a clever sketch of the wavy steps leading to the chapter-house, and one of the lectern, besides another example from Yeovil. Mr. R. S. BALFOUR has a pencil drawing of Yatton Church, which, on account of the truncated steeple, would not at first sight be recognised as a Somersetshire example.

Mr. CECIL BREWER must be endowed with extraordinary patience, or he would never have completed his drawings of "Bishop Gower's Screen" in St. David's Cathedral. It suggests a fine design that was translated by the builders in a way that was intended to gratify local taste. Some of the capitals are heads of men that are without lower jaws. Elsewhere several heads are placed in a row without any respect to scale, and there seemed to be a passion for caricatures of humanity. But the ornamentation is often elegant. The original drawing is in pencil, and it is well to have a reproduction of a permanent character in the Sketch-Book, for it would be cruelty to compel the lines to be inked in. Mr. BREWER also shows two of the poppy-heads in the cathedral, which are examples of elaborate carving. In one the arms of Bishop TULLY are introduced.

Although SCOTT advised all who wished to see Melrose at its best to visit it by the pale moonlight, yet the remains of the abbey will sustain examination and drawing by daylight. Mr. F. J. WASS supplies four plates from Melrose. They will give a clearer notion of the quaint fancies of the sculptors than is likely to be derived from an ordinary visit to the ruins. Plant forms especially appear to have captivated them, and Mr. WASS has drawn the detail with an attention which should be recognised. Mr. J. A. R. INGLIS has a washed drawing of Roslin Chapel, a building against which architects are prejudiced on account of the admiration bestowed on parts which are not remarkable for artistic worth. It will be evident that the examples from this country are mainly ecclesiastical, but as they are generally excellent and suited to test the skill of draughtsmen, there is no reason to complain of the number.

The two French examples are by Mr. C. C. BREWER. One shows stalls at Tréguier. The principal example evidently represents some local miracle, for a bishop is seen and appears to be about to rescue a victim from a dragon's mouth. A capital looks as if made up of knotted serpents. The second plate is occupied with a screen, stalls and gate from Rougasnou, of later date than the former and designed with more regard for comfort.

The five drawings from Belgium, by Mr. J. A. SWAN, suggest the interest of Flemish work of the fifteenth and sixteenth centuries. The "Grunthuyse Pew in Notre-Dame" is a tremendous receptacle, and would serve as well for the dead as for the living. It is a specimen of over-florid Gothic, but it will bear examination. A view under the façade of the Hôtel de Ville, Brussels, presents some of the

emarkable feats of stone-cutting with the intention of uggesting that vaulting was self-supporting. The view in he Rue des Sols, Brussels, reveals some of the interesting ubjects which remain in the byways of the city, and the imber house in Malines is evidence of the gain which a ew figures properly placed can impart. The "Maison des Bateliers," in Ghent, is a favourite subject, and it is here lrawn with care, but the green colour diminishes the effect of much careful work. Considered merely as an illustration, he Düreresque plate of "The Rathhaus, Münster," is the most impressive in the collection. There are no ruled lines, but the pen was used with decision, and solid black masses are liberally introduced. With all the elaboration the drawing appears to be a sketch which was expeditiously completed by Mr. BERESFORD PITE.

As a rule the monumental sculptor's work is not much appreciated, although many of the most successful efforts of modern architects and sculptors take that form. Of late years an exception has been made in favour of Italian monuments. The reason of course is they abound in detail which often may have had a Greek origin. The general design when commonplace, as is often the case, is redeemed by the elements. Take the famous Marsuppini monument, of which there is a cast at South Kensington. What meaning, for instance, can be given to the two figures like the supers who come on the stage as fishermen of Naples in "Masaniello," and who carry enormous swags instead of nets? The old Professor (he deserves remembrance for his epitaph of BRUNELLESCHI) also lies uncomfortably on his side in order to exhibit his face to the spectator. We doubt if any one of the bits of ornament is DESIDERIO DA SETTIGNANO'S invention, but they are so exquisitely chiselled nobody would wish one of them away. Mr. F. H. WARING has drawn the difficult monument with a feeling for what is characteristic in it, and it is a work with which few have succeeded. The "Altar Frontal" in the Museum of Florence, which is attributed to GIOTTO, appears on four plates by Mr. MASEY. He has caught the spirit of the original, which is remarkable alike for its design and execution. The series is another of the successes of the volume. S. Maurizio, Milan, is a fine church, with fewer aberrations than are found in buildings which gain more admiration. Mr. C. A. NICHOLSON'S drawing of a bay was intended for his own use, and is therefore different to an illustration which may be mainly intended for the uninitiated. The drawing is made to scale, but all the principal dimensions are figured. The materials employed and their colours are carefully described near the parts where they are found. It is easy to see from the indications that the whole could be elaborated and become an impressive view, but it was considered the time might be better occupied. Here we see what struck the visitor, and from the notes can infer the reasons. It would be an advantage if more drawings resembled Mr. NICHOLSON'S. His "Marble Stairs, Verona," is similarly treated, but there was less need to become descriptive. Mr. COMYN has two drawings of one of the Italian chimney-pieces at South Kensington. Mr. H. S. EAST has a drawing of the entrance to the subterranean chapel in Modena Cathedral, with its strange lions and crouching figures, and three careful geometrical drawings from S. Zaccaria, Venice. Mr. H. V. LANCHESTER has persuaded the editors to produce in colour his two drawings of a part of the pavement in the House of S. Caterina, Siena, by which their interest becomes more evident. He has also a monochrome of a doorway in S. Maria dei Miracoli, Venice, and brings the volume to a close with the "Tomb of Ferdinand and Isabella" in Granada, which in many respects is reminiscent of Italy.

WILLIAM MORRIS.—II.*

IT appears that WILLIAM MORRIS once described himself as a man who endured a life of insults, and whose brains were sucked. The words must have been uttered in a moment of despondency or of self-glorification. Every successful manufacturer expects to be imitated, in spite of patent laws and registration Acts; but if we may be allowed to say so, there was an amateurism about many of MORRIS'S productions which was inimitable, or at least by those who were well drilled as designers or as workmen. In the days when MORRIS was only tentative in his renderings of colours there were various muddy compounds brought forth which were taken to be prepared by him, and the recollection of some of the greens is enough to bring a bilious attack on anyone who loves colour. An occasional simple pattern may have appeared in a still more simple form, and we have seen cabbages of a size and extravagance which were enough, if Mr. MORRIS were sensitive, to make him regret that he had ever taken up the manufacture of wall-papers. But the characteristics of his work were not of a kind to be recognised at a glance, and were, therefore, not adapted for imitation. On that account we are disposed to doubt whether the "Morris style" can have much endurance. The originator adopted the selfish plan of avoiding the training of disciples. Although for thirty years he was presiding over works of a varied sort, not one industrial artist of any account can be said to have derived inspiration from him. His friends will say that he did not care for imitators. But where are the pupils or assistants, who have displayed originality and who drew inspiration from Mr. MORRIS? The weakness of the case is suggested when we find Mr. MACKAIL speaking of the seed sown by MORRIS, and which had long been silently and unostentatiously bearing fruit in Mr. CRANE, Mr. COBDEN-SANDERSON, Mr. SUMNER, Mr. LETHABY and Mr. BENSON. Did any of them receive wages from WILLIAM MORRIS? That he raised designing and manufacturing to a different sort of plane may be granted, and that they also were not ashamed to share in industrialism or trade may be allowed, but he did not help in making them competent.

As we suggested last week, the success of WILLIAM MORRIS when he took to business was to a great extent based on factitious interest rather than on the qualities of his work. When Mr. MACKAIL says, "A man of means and University education who deliberately kept a shop, a poet who chose to exercise a handicraft, not as a gentleman amateur but under the ordinary conditions of handicraftsman, was a figure so unique as to be all but intelligible," he reveals the secret of the foundation of the prosperity of MORRIS & Co. It was an age when the antitheses of MACAULAY made contradictory qualities popular, and here was a man in Red Lion Square who appeared to be formed as a subject for the rhetoric then in fashion. An account by a lady who went in company with Mr. VAL PRINSEP to buy two glass tumblers suggests the state of mind of the early patrons of the firm. The day was foggy, and what was seen in the simple show-room became bewildering. MORRIS recommended a pair of tumblers because they would stand firm on a table. Mr. PRINSEP praised their shape. The two artists wrapped them in paper and, the lady says, "I came away very much amused and interested, with a general impression of sympathetic shyness and shadows and dim green glass." Yet the whole transaction consisted in the purchase of two glasses. But under the conditions of sale, with a poet for a shopman, we suppose they appeared as worthy of being used to contain nectar which was to be imbibed by goddesses. When so much could be done with domestic glass it is easy to see how transcendental more costly articles could be made to appear.

A great many traders would have realised that "sympathetic shyness and shadows" were enough to carry the day against all customers who came upon the premises. WILLIAM MORRIS was too honest for any trickery. He endeavoured to make everything he sold of as sterling a quality as was practicable. He did not spare the workmen in his speech, and he once smashed the door of a workshop with a folio which he hurled at some offender. Apparently he was not much given to woodworking, and the making of furniture gradually ceased to be a specialty of the firm, for without his close supervision men were liable to act in Red Lion Square as elsewhere. The branches in which MORRIS could please himself by a participation became the staple of the firm. He once said, "If I were to work ten hours a day at work I despised and hated I should spend my leisure, I hope, in political agitation, but I fear in drinking." Happily there was much in which he could find great pleasure through corresponding with the gifts he possessed. Speaking of 1857 Mr. MACKAIL says, "His wonderful faculty of pattern-designing had already come to him, and with it a unique sense for justness in colour, fed on

* *The Life of William Morris.* By J. W. Mackail. New Impression. (Longmans, Green & Co.)

admiring study of the best early Mediæval works, especially in illumination." He could not draw all kinds of forms with ease, and was often obliged to invoke the aid of PHILIP WEBB and BURNE-JONES. But it has been ascertained that of MORRIS's own designs about 600 were reproduced in various materials, and the number would be increased if those in which he co-operated and inspired were counted. With all his love for Mediæval practices he was not disposed to trust to inspiration of workmen, and his own practice is indicated in his advice about the necessity of definiteness in preparing designs for them:—

Be careful to eschew all vagueness. It is better to be caught out in doing wrong when you have had a definite purpose than to shuffle and slur so that people can't blame you because they don't know what you are at. Hold fast to distinct form in art. Don't think too much of style, but set yourself to get out of you what you think beautiful, and express it as cautiously as you please, but, I repeat, quite distinctly and without vagueness. Always think your design out in your head before you begin to get it on the paper. Don't begin by slobbering and messing about in the hope that something may come out of it. You must see it before you can draw it, whether the design be of your own invention or nature's. Remember, always, form before colour, and outline, silhouette, before modelling, not because these latter are of less importance, but because they can't be right if the first are wrong.

Another consideration which he insisted on was the connection between design and its manner of reproduction. He would have the artist thinking always of the material and of the process to be employed. Although more than any of his contemporaries he aided and abetted the South Kensington system of preparing designs which were supposed to possess universal applicability and to be independent of material, he adopted a contrary system in his own practice. MORRIS's connection with the Science and Art Department was one of the inconsistencies which it is impossible to explain. No doubt he felt indebted for the purchase of tapestry which might have been intended for his special use. But the examination of designs was a kind of labour in which he could find no pleasure, and to assign rewards to many of them was to condemn his own principles. But his biographer says "he stuck to it for the sake of the good that might ultimately come of it; and in the latter years of his life he had the satisfaction of seeing in London and elsewhere, noticeably at Birmingham, a real school of manual art slowly form itself whose work was directly aimed at practice." Mr. MACKAIL must forget there was no slow evolution of a municipal school in Birmingham, Manchester, Nottingham, or wherever the institutions now flourish. In each case it was a sudden revolt against the costly uselessness of the Departmental teaching. The revolution was accomplished against the will of "My Lords." Instead of hastening the change MORRIS retarded it. He was accepted as the representative of manufacturers, and he allowed his name to be used as if he were responsible for the instruction which was followed, and which has imperilled British industries. We gladly, however, turn from this subject to consider further the business of the firm of MORRIS & Co.

When the business was started there was reliance on work for churches, in which the partners were not disappointed. Mr. STREET and Mr. BODLEY gave commissions for decorative and other work. Stained-glass became a specialty, and MORRIS's share in the production is thus described by Mr. MACKAIL :—

As regards the personal part which Morris took in this branch of the firm's work, it was the invariable practice in early years, and remained the rule after the Merton Abbey works were started, that the interpretation of the design and the choice of the glass came under his own eye. He seldom at any time, and never in more recent years, made complete designs for windows himself. From the first the figure subjects were mainly supplied by those of his colleagues who were professional painters. As time went on they came almost exclusively from the studio of Burne-Jones, who supplied no cartoons for glass except to the firm. But backgrounds and foliage were, as a rule, of Morris's designing, the animals and certain kinds of ornament being often drawn by Webb. Morris never made his own glass. He often regretted that he did not, but for organising this manufacture time and money alike were required beyond what he could spare. There is little doubt that in the colouring of glass, as in that of yarns, his personal touch would have produced greater splendours of tone than could be got by other workers. As it was, his faultless eye for colour had to content itself with doing its best out of the glass supplied by the ordinary manufacturers. If the colour of a Morris window is to the present day unmistakable among all rivals or imitations, this is not from any difference of the material, but from the skill in selection and variation which was an instinct in Morris himself, and which he, in some considerable degree, transmitted to his workmen.

In justice to WILLIAM MORRIS it must be stated that, after he had established the Society for Protection of Ancient Buildings, he announced that in accepting work an exception would be made whenever the window was to be considered as a monument of ancient art. Accordingly, the order was declined which was offered by Dean STANLEY for a window in Westminster Abbey.

The power of treating colour which was seen in the windows, with the skill of BURNE-JONES as a figure draughtsman, led to the production of tapestries. As that variety of weaving had become a lost art in England, it was courageous to attempt a revival. Moreover, it was not to be expected that a call for works of the class would be immediate. MORRIS, according to his custom, resolved to have a practical acquaintance with the technique of weaving. For that purpose he had a loom erected in his bedroom at Hammersmith, and was seated at it as soon as daylight appeared. It was calculated that in four months he devoted 516 hours to weaving, and at the same time attention had to be given to the other branches of his business. In taking up tapestry he was exemplifying the importance of early associations. In the course of a letter he said :—

How well I remember as a boy my first acquaintance with a room hung with faded greenery at Queen Elizabeth's Lodge, by Chingford Hatch, in Epping Forest (I wonder what has become of it now?), and the impression of romance that it made upon me—a feeling that always comes back on me when I read, as I often do, Sir Walter Scott's "Antiquary," and come to the description of the Green Room at Monkbarns, amongst which the novelist has with such exquisite cunning of art embedded the fresh and glittering verses of the summer poet, Chaucer. Yes, that was more than upholstery, believe me.

Nor was poetic composition neglected for the handicrafts. Manual labour excited thought, and as he said, "If a chap can't compose an epic poem while he's weaving tapestry, he had better shut up; he'll never do any good at all." With a mind so constituted WILLIAM MORRIS could spend hours on embroidery, dyeing, copying manuscripts and other varieties of labour, without any misgiving that he was allowing his intellect to remain unexercised. Yet there were many people who considered he was only employed in a light superintendence, for to outsiders he rarely seemed to be an operative overburdened with work.

For a quarter of a century he was able to find all the relaxation he needed by visits to the Manor House, Kelmscott, his Elizabethan house about two miles above Radcott Bridge on the Thames, and thirty miles from Oxford. His happiness there was expressed by MORRIS when he said, "O me! O me! How I love the earth, and the seasons, and weather and all things that deal with it, and all that grows out of it—as this has done! The earth and the growth of it and the life of it! If I could but say or show how I love it!" However intense was his love for the country, he was not the man to retire from life for the pleasure of planting cabbages. Like a true Norseman, he enjoyed the struggles of life, of which in our time towns are the theatre. There can be no doubt his existence was shortened by his assumption of labours which were beyond human strength. We doubt if a more versatile man was ever found in England, and he was one who did not take up callings by starts or lay them down heedlessly. So complex a character is not easily fathomed, and that Mr. MACKAIL has so well succeeded in presenting WILLIAM MORRIS before us is creditable to his skill as a writer and as a student of life and the arts.

The Prizes of the Académie des Beaux-Arts have been awarded as follows :—The Prize Brizard, value 3,000 francs, to M. Jacques Comoreyt, for a marine view; the Prize Maxime David, value 400 francs, to Mdlle. Cécile de Chaussée, for miniatures: the Prize Piot, value 2,000 francs, to Mdlle. Delasalle, for a painting.

THE COLCHESTER TOWN HALL.

AN interesting brochure has been prepared by Messrs. Wilson Marriage and W. Gurney Benham upon the new Colchester Town Hall. The aim of the authors is to make the building, by means of its decoration, suggestive of the historic interest of the ancient town. Sculpture, stained-glass and painting could be well employed on so laudable an object. Utility is indispensable in a municipal building, but other qualities can also be recognised without loss to the people. Messrs. Marriage and Benham's effort is therefore deserving of recognition throughout Essex and elsewhere.

In order to give some idea of the many incidents in Colchester history which lend themselves to pictorial illustration, by means of paintings, drawings, bas-reliefs, stained-glass, or other designs the following list is introduced.

A.D. 50 (circâ).—Foundation of a Roman colony at Colchester by Claudius I., Emperor of Rome, as a monument of the victory obtained by him at Camulodunum. The Emperor defeated the Britons in a pitched battle, commanding the Roman forces in person. He gave to the place the title of Claudiana Victricensis, and directed the colonists to erect a temple in his honour. The picturesque ceremony of laying out a Roman colony, accompanied by various religious functions, is described in detail by Roman writers.

A.D. 50 (circâ).—The Roman pottery at Colchester. The ancient kilns, discovered March 1877, and still carefully preserved, would give material for this subject, as would the great variety of vessels of various kinds in the museum.

A.D. 61.—The destruction of the Roman colony at Camulodunum by Boadicea. See "Tacitus, Annals," Bk. 14, ch. 31 and 32.

A.D. 921.—Expulsion of the Danes from Colchester during harvest, when "much people from Kent and Surrey and Essex, and from each of the nearest towns, went to Colchester and beset it and fought against it, until they mastered it and slew all the people (Danes) there within, and took all that was there except the men who fled over wall."

A.D. 922 (November).—Visit of Edward the Elder to Colchester. He directed the reparation of the town walls.

A.D. 930 (circâ).—Æthelstan's Witanagemôt at Colchester.

A.D. 1097.—Colchester under Norman rule. Dedication of St. John's Abbey, founded and built by Eudo Dapifer. Eudo himself laid the first stone, 1097, "after Easter"; his wife, Rhodesia, a second; and her brother, Earl Gilbert, a third. Other stones were laid by other persons. See the "Chronicle of St. John's Abbey."

A.D. 1120.—Burial of Eudo Dapifer at St. John's Abbey, March 1120. His body was brought thither from Préaux, in Normandy, where he died.

A.D. 1216.—Colchester taken by Prince Louis, son of Philip II. of France.

A.D. 1516 (May 25).—The reception of Queen Catherine of Arragon and her retinue, at Lexden, by the bailiffs, aldermen and burgesses.

A D. 1539 (Dec. 1).—John Beche, abbot of St. John's, Colchester, according to tradition, entertained at a feast by the magistrates, who "then showed him the warrant for his execution and went and hanged him without further warning or ceremony."

A.D. 1555-58.—Burning of martyrs in Colchester during the reign of Queen Mary.

A.D. 1571.—Arrival of the Dutch and Flemings, and establishment by them of the bay and say trade.

A.D. 1579.—Visit of Queen Elizabeth in her progress of 1579 to Colchester, September 1 and 2, when the bailiffs, aldermen and council met Her Majesty in state, the bailiffs and aldermen riding "upon comely geldings with foot-clothes in damask or satin cassocks or coats, with satin sleeves in their scarlet gowns, with caps and black velvet tippets." The council, also mounted upon "comely geldings," were attired "in grogram or silk cassock coats or jackets, with silk doublets or sleeves in the livery morray-gowns, with caps," &c. The Queen was presented with a silver gilt cup, value 40*l.*, and an oration was made to Her Majesty by the Recorder. The Queen was entertained by Dr. William Gilberd at his residence, Tympperleys, Trinity Street.

A.D. 1588.—The town furnished three ships to aid in the defence of the realm, viz., the *Foresight*, the *Margaret and John* and a pinnace, the *Mark Speedwell*. They were furnished for two months with victuals, mariners, ammunition, &c. To meet the expense a special rate was levied on the town of 2*s.* in the pound on all goods, and 3*s.* in the pound on land.

A.D. 1639.—Visit of Maria de Medici, Queen of Henry IV. of France, and mother-in-law of Charles I., to Colchester with her retinue. Her reception by the Mayor and Corporation. (N.B.—There is a contemporary print of this incident by the Queen's artist.)

A.D. 1648.—The siege of Colchester, June 13 to August 28—

1. Refusal of the townspeople to admit Sir Charles Lucas and his force.

2. The message of Fairfax to Sir Charles Lucas, and his derisive answer to the trumpeter who conveyed it.

3. Repulse of the Parliamentarians after a hand-to-hand contest at Head Gate. Lord Capel fastens the gate with his cane.

4. Sortie from East Gate.

5. Horse mills for grinding flour are erected, and kept at work under the superintendence of Lord Loughborough. The Mayor refuses to set up mills, and is expostulated with and threatened by Sir Charles Lucas and Lord Loughborough. The clamour of the inhabitants against the Royalist forces.

6. A horse is roasted whole at the North Gate "to make the soldiers merry at their entrance into such diet."

7. The women and children crowd round the quarters of the General (Lord Norwich), "throwing themselves on the ground before the guard with frantic outcries for bread," and "daring the soldiers to fire their pieces, exclaiming that they had rather be shot than starved."

8. Lord Fairfax enters the town after its surrender, and proceeds to the Moot Hall.

9. The execution of Sir Charles Lucas and Sir George Lisle, Sir Bernard Gascoigne being reprieved at the place of execution.

A.D. 1665-66.—The plague at Colchester, August 1665 to December 1666, causing during that period the deaths of 4,731 persons.

A.D. 1693.—William III. visits Colchester, and confers knighthood upon Sir Isaac Rebow, who entertained His Majesty.

A.D. 1734.—Queen Charlotte (then Princess Charlotte of Mecklenburgh) and her suite visit Colchester. Her Royal Highness is presented with a case of Colchester's famous "candied eringo roots."

A.D. 1750 (circâ).—A primitive "Oyster Lunch," the origin of the Annual Oyster Feast on St. Denis' Day.

A.D. 1856.—Visit of H.R.H. Prince Albert (Prince Consort) to Colchester, and presentation of an address at the Town Hall.

A.D. 1884.—The Colchester Earthquake, April 22.

A.D. 1892.—Opening of the Castle Park, Colchester, by Sir David Evans, Lord Mayor of London.

A.D. 1894.—Opening of the Public Library by Lord Herschell, Lord Chancellor, October 25.

A.D. 1896.—Inauguration of the University Extension College by the Earl of Rosebery, October 20.

A.D. 1897.—Celebration of Her Majesty's Diamond Jubilee at Colchester, June 22.

A.D. 1898.—Laying of the foundation-stone of the new Town Hall, October 31, by H.R.H. the Duke of Cambridge.

Sculptured mantelpieces for Mayor's parlour and other rooms. Subjects suggested (to be treated decoratively):—

1. The legend of Helena and the invention of the Cross.

2. The early ecclesiastical foundations of Colchester, St. John's, St. Botolph's Crutched Friars, Grey Friars, &c., Guild of St. Helen.

3. The siege of Colchester. Decorative military emblems of the period with medallion portraits of officers of each camp.

4. Regalia of Colchester, arranged in decorative fashion.

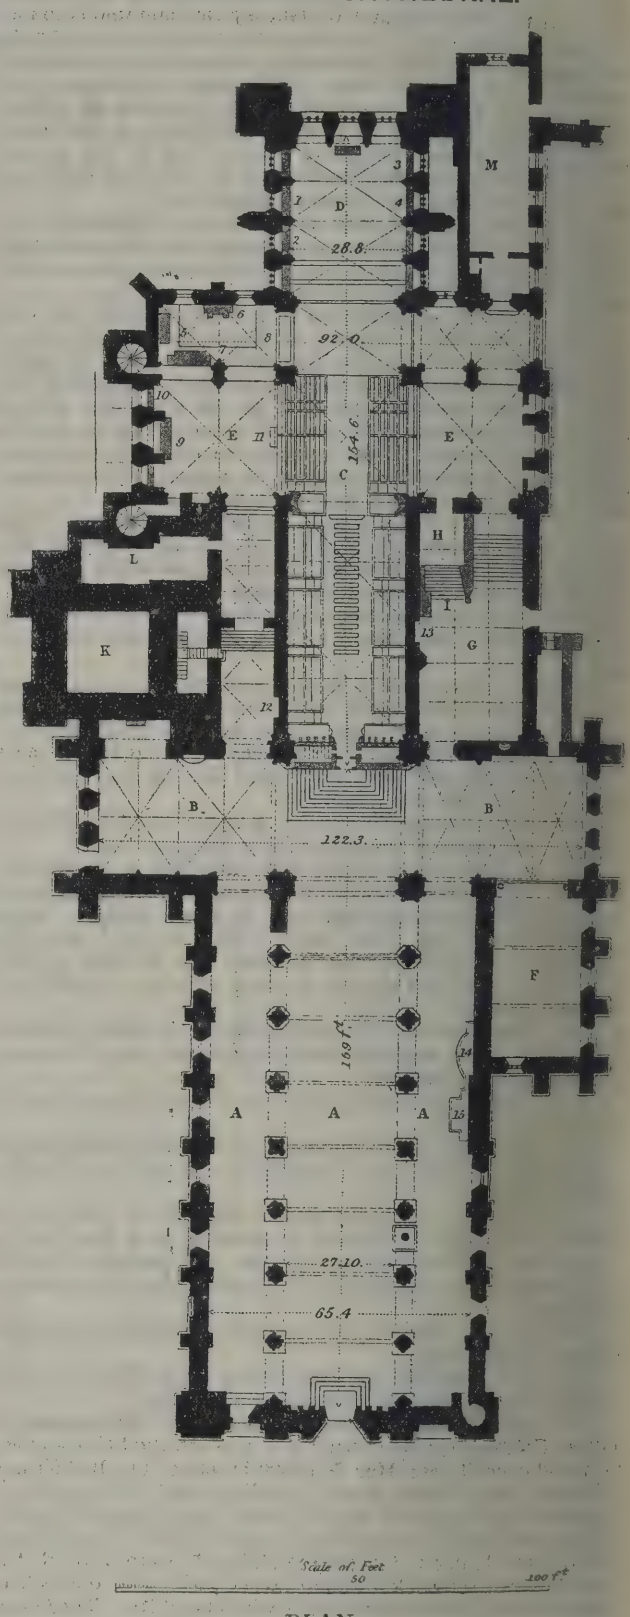
5. Antiquities of Colchester—sphinx, centurion, Colchester vase, &c., &c.

The cost of these mantelpieces would range from about 50*l.* to 150*l.* each, according to design and material.

THE LORDS AND THE ROYAL ACADEMY.

ON Monday Lord Stanley of Alderley inquired if the Government would give effect to the following recommendations of the select committee of 1836 and of the Royal Commission of 1863 with respect to the Royal Academy:—(1) That the Academy should rest on a wider and more liberal basis, and be viewed as a national institution, and that it should have a charter in lieu of the instrument of 1768; (2) that an annual report should be published of the proceedings of the Academy, with a statement of its income and expenditure, duly audited; (3) that all voting for R.A.'s or Associates should be open; (4) that the Academicians and Associates now existing should send four works as of right, and never more, and that Associates henceforth elected should send no work as of right, and never more than four; (5) that the charge for admission should be 1*s.*, as heretofore, but on Mondays it might be raised to a higher sum, and that the exhibition should be wholly free on Saturdays; (6) that the system of the teaching hitherto followed is not satisfactory; (7) that the system of teaching which prevailed in France seemed well worthy of consideration, and that the annual balance sheet of the accounts of the Academy should be printed and submitted along with the annual report to the general assembly. He also called the attention of the House to the repudiation by the Royal Academy of their responsibility as bailees for damage to works confided to their custody, and also to the 60,000*l* of the Chantrey Bequest, of which the Chantrey Trustees gave no account.

The Marquis of Salisbury in reply said:—I think that the



ground fallacy of my noble friend's speech is the impression which he appears to entertain that a Commission must always be attended to, and that, as a matter of fact, a Commission always is attended to. Now that is not my experience of public life. I have witnessed the appointment of a great number of Commissions, but my impression is that a very small percentage have received any notice from legislators or from Parliament. My noble friend is a man of very great industry, and if he would devote himself to ascertaining how many Commissions during the last sixty years have reported and how many of those reports have given ground for any action, he will furnish a very important contribution to the history of his time. I think I know several Commissions now pending that have not the slightest probability of any action being taken upon them. But my noble friend appears to look forward to a period, which Lord Wemyss glanced at on a previous occasion, when the Government should undertake the management of the Royal Academy. I confess that I think this undertaking is reserved for bolder hands than mine. I hope that if there is to be an artistic party in Parliament, which will prescribe for the various artistic bodies what they ought to do, they will organise themselves in some such way that all their recommendations may have a unanimous tendency. I am afraid that the dreams of my noble friend and Lord Wemyss are still far apart in the remedies they recommend for the consideration of Parliament. But the practical point is, "Are the Government going to introduce any measure this session to alter the constitution of the Royal Academy?" I have had the privilege to hear the exposition of the state of public business which my right hon. friend the leader of the House of Commons has to-day made before that body. I think that when my noble friend comes to read it he will agree with me that the task of introducing any such thorny and difficult subject as the reform of our artistic institutions is not likely to be undertaken in the two months which yet remain of the session. There is no subject which produces such a healthy difference of opinion as questions which relate to art, and consequently there is no subject which is likely to make so great a demand on the time of Parliament. I certainly should think it very imprudent of any Minister to undertake such a task, unless he is driven by very much greater evils and defects than it is possible to show in the present management of the Royal Academy. On the whole, the results appear to me to be quite as good as they are likely to be by introducing the Civil Service into the management of the Royal Academy, and I doubt whether any addition of politicians to the governing bodies of our great art institutions will add much to the value and beauty of their work.

CONSISTORIAL COURTS.

AT the last monthly meeting of the Royal Archæological Institute, Chancellor Ferguson read a paper on "Consistorial Courts and Consistorial Places." In his introduction he explained the nature and origin of archiepiscopal, episcopal, archidiaconal, and preba-decanal and prebendal courts; also with courts of peculiars and other exempt jurisdictions. Prior to the Wills Act of 1857 nearly 300 of these courts had testamentary jurisdiction in England; the confusion thus created was made worse by the way in which the archiepiscopal and episcopal courts inhibited the others for various periods during the episcopal visitation, three, six or twelve months. Dealing afterwards with each diocese, he detailed the various courts existing in each at the date of the Parliamentary returns of 1829 and 1830 embodied in two Blue-books, which are happy hunting-grounds for the ecclesiastical antiquary. The old diocese of Carlisle was only troubled with two exempt jurisdictions—Templesowerby and Crosby Ravensworth, neither of much importance—the first a manor which once belonged to the Knights Templars; the other one which formerly belonged to the monastery of Sempringham in Yorkshire. He also dealt with the consistorial places, so far as the archbishops and bishops are concerned, and described how they used to be enclosed, furnished with seats, and a table for the registrar and the proctor, and with a chair of state and a canopy for the judges, whether chancellor or commissary. Since the Wills Act these courts have been little used, particularly in parish churches, and even in cathedrals have been pulled out to make room for organs, organ-chambers, monuments, or choristers' vestries. The furniture of these courts was generally Jacobean in character, having been put in at the revival of ecclesiastical courts in the seventeenth century, and so was hateful to the restoring architect and parson.

Sir Henry Howorth, M.P., pointed out that the Dean of Salisbury, who once had testamentary jurisdiction over several courts of peculiars, still retained the right to grant marriage licences. The Chancellor instanced Buildness in Shropshire, a parish and peculiar of 100 inhabitants, where the vicar once had the same right, and was wont to celebrate over 100 marriages a year; the place became a local Gretna Green and a scandal. In answer to a question the Chancellor explained the origin of donations.

ADORNMENT OF CHURCHYARDS.

A DECISION has been given by Dr. Tristram, Q.C., as Chancellor of the Diocese of London. After hearing the application for a faculty to enable the vicar and churchwardens of St. Botolph's, Aldersgate Without, to make alterations in the churchyard, the Chancellor said the place was some years ago laid out with great taste as a garden and thrown open to the public, and additional ground had since been, by the liberality of the public, provided at a cost of 6,000*l.*, more than a third of which had been contributed by the Kyrle Society and the Metropolitan Public Gardens Association. The churchyard and grounds had now become a much-frequented resort for persons resident in the neighbourhood. The north side of the church was at present separated from Little Britain by houses, which were about to be taken down to widen that thoroughfare. That would necessitate the erection of a churchyard wall to separate the churchyard from the street, and Mr. G. F. Watts, the eminent Royal Academician, had generously offered to decorate the wall with frescoes delineating acts of heroism which had occurred in the humbler classes of life. For the purpose of protecting the frescoes from exposure to the atmosphere Mr. Watts proposed, at his own cost, to construct a covered way against the wall, with free access to the same from the churchyard and grounds, subject to a faculty being granted. His offer had been accepted by the unanimous vote of the vestry. The question for the consideration of the Court was, whether the covered way would be a building such as was prohibited from being erected on a disused burial ground by the Disused Burial Grounds Act, 1884, and the Open Spaces Act, 1887. If it was such a building it would be the duty of the Court to decline to grant the faculty; but if not, it would be its duty to grant it. Section 3 of the first Act enacted :—"It shall not be lawful to erect any building upon any disused burial ground except for the purpose of enlarging a church or other place of worship." Section 14 of the second Act enacted that the two Acts were to be read as one, and the preamble to the second recited that by the Metropolitan Open Spaces Acts, 1877 and 1887, certain facilities were provided for making available the open spaces and burial grounds in the metropolis for the use of the inhabitants for exercise and recreation, and that it was expedient to provide facilities for making available open spaces and burial grounds. Section 4 of the same Act provided that the expression "building" in the Statute of 1884 should include "any temporary or movable building." The question that the Court had to determine was whether the proposed structure would constitute a "building" such as was prohibited by those two Acts from being erected on a closed burial ground. It certainly would not contravene either the letter or the spirit of the second and governing Act, one of its objects being, according to its preamble, to secure to the inhabitants of every parish ground available for their exercise and recreation, as the site to be covered by this structure would, after its construction, remain as available for their exercise and recreation as it now was, and in inclement weather it would make it more available for such purposes than it was at present. Since the hearing he had referred to the cases bearing on the construction to be put on the expression "buildings" when used in covenants or in Acts of Parliament. The case nearest in point to the present one was that of Foster *v.* Fraser (9, *The Times* Law Reports, 502). In that case part of a residential estate had been sold to the defendant Fraser subject to a covenant that any building to be erected thereon by him or his assigns should be at least 36 feet high, and, if it faced east, should have a stuccoed or cement front, and if north should be pointed with white stock bricks and have a slated roof, and should be used only as a dwelling-house. The defendant leased the land to an advertising company, who erected on it a hoarding from 8 feet to 14 feet high, which was used as an advertising station. In an action for breach of covenant against the defendant on the ground of the erection of this hoarding by his lessee, Mr. Justice Kekewich held that the erection of the hoarding did not constitute a breach of the covenant, as the requirement of a stuccoed front or slated roof was not suitable to a hoarding, and that the expression "building" in that case must therefore be read in a restricted sense, and not as referable to a hoarding. The Court was of opinion that, as after the construction of this covered way the whole of the churchyard would practically remain as much an open space for the exercise and recreation of the inhabitants of the parish as it was at present, and as this was really what the second Act aimed at, the introduction of the covered way would not contravene its provisions. Moreover, the covered way was intended as a protection for frescoes erected as memorials to meritorious persons, which might be as appropriately and legitimately placed in a disused as in a used churchyard. The Court therefore decreed a faculty authorising the erection of the proposed frescoes and the construction of the covered way for their protection.

DURHAM ARCHÆOLOGICAL SOCIETY.

THE second meeting for the year 1899 is being held yesterday and to-day, June 22 and 23, in Haddingtonshire, and arrangements were made for members to drive to the following places of interest in the order given :—Preston Kirk, with a small First Pointed choir, one of St. Baldred's churches ; Tyninghame (by permission of Lord Haddington), where are the church and monastery of St. Baldred, a cell to Lindisfarne. Norman arches, choir and apse ; St. Mary's, Whitekirk, built 1413, a great resort of pilgrims, made dependent on Holyrood by James I. in 1430 ; Pele Tower at Whitekirk, with tithe barn added. Tantallon Castle, the stronghold of the Douglas ; the first owners were the Earls of Fife, and it was given to Douglas by James II., besieged by James V. and Douglas attainted ; he was restored in 1542. Sadler came here to negotiate the marriage of Mary and Edward ; a small ruin of a house of the Douglas may be seen at Auldham. Dirleton Castle, with extensive remains, great gateway, hall with canopied seat, fine octagonal vault ; a possession of the Norman family of De Vaux, afterwards of the Ruthvens and Nisbets. Wallace held it in 1298, and attacked the English troops ; it was surrendered to Antony Bec of Durham, and afterwards became possessed by the Haliburtons. North Berwick Nunnery, fragmentary remains ; has on the north side a small example of the Scottish Domestic architecture. Members dined, stayed the night and breakfasted this morning at the Marine Hotel, North Berwick, and left by the 8.45 train for Longniddy station, from whence they were to drive to Seton, where they will see the Collegiate Church, made collegiate in 1493 by Lord Seton. The north transept, tower and spire were built in the sixteenth century by Lady Seton after her husband's death at Flodden. It has a stone roof, a monument of the founder and his wife, a cell behind monument, sacristy with upper chamber and remarkable windows in transept. From Seton members will drive to Haddington, where the parish church erroneously called the abbey or Franciscan Friary will be examined. It was founded by David I. and rebuilt in the early part of the fifteenth century. It has choir arcade on piers of diminutive height, no triforium, was originally vaulted, shafts resting on main pier caps. There is Renaissance work in Lauderdale Chapel. The nave was altered in 1811, and arches raised to make room for galleries. The tower was formerly crowned with a canopy of open work, and a corbel in centre of east face indicates a rib from the sides as well from the angles. From Cockburn's Path they will walk to Dunglass Collegiate Church, founded in 1403.

DUNDEE INSTITUTE.

THE following are the subjects for the competitions of the Dundee Institute of Architecture, Science and Art, for the session 1899–1900 :—

No. 1. Freehand sketch-book of architectural subjects from existing buildings, not less than six pages, in pencil only, not copied from any drawing. Size of page not larger than 10 inches by 7 inches.

No. 2. Measured drawings of any architectural subject in black and white, and not more than four or fewer than two sheets, containing plan, elevation and section to $\frac{1}{8}$-inch or $\frac{1}{4}$-inch scale, and detail of a part to one-twelfth full size. Measurement books to be lodged. Size of drawing 19½ inches by 13 inches, with margins or mounts beyond drawing not exceeding 3 inches.

No. 3. Sepia or chalk drawing, from an antique subject in the Dundee Art Museum of Casts or from duplicates thereof. Size of work 19½ inches by 13 inches, with margins or mounts beyond drawing not exceeding 3 inches. Illustrations of architectural historic ornament preferred.

No. 4. Design for decorative treatment of the interior of a billiard-room, showing furniture, &c. Size of work 19½ inches by 13 inches, with margins or mounts beyond drawing not exceeding 3 inches.

No. 5. Design for village hall to seat 400 persons, and including caretaker's house and suitable retiring-rooms. Site, a corner on north side of main street, ground rising 1 in 10 from main street and level E. to W. Plans showing accommodation, at least two elevations and one section, all to $\frac{1}{8}$th inch to a foot scale. Sketch view may be given.

No. 6. Design for golf club house for 150 members, including at least greenkeeper's rooms, club-room, smoke-room, committee-room, refreshment-room and lavatories. Site on south side of road between road and course, and falling 1 in 20 toward course. Plan or plans showing all usual and necessary accommodation, at least two elevations and one section, all to $\frac{1}{8}$th inch to a foot scale. Sketch view may be given.

No. 7. Design for fireplace in stone for hall in mansion house ; any style. Plan, elevation and section to 1 inch to a foot scale. Details to one-fourth full size.

No. 8. Album containing not less than twelve large-scale photographs of architectural details from existing buildings ; quarter-plate. Long distance pictures not desired.

NOTES AND COMMENTS.

M. RODIN, the sculptor, has obtained a concession from the city of Paris which must make many other artists discontented. In the International Exhibition of 1900 there will be necessarily a restriction on the number of works which can be received from each artist. Few men can expect to have a compartment reserved for them in which they will be able to do justice to their ability. M. RODIN, recognising the fact and also that his works have been made the subject of many controversies, decided to present them as completely as possible, and leave to the public the privilege of judging them. Accordingly he applied for a position in which he could hold a special exhibition. The municipality has allowed him a site in an excellent position—that is at the junction of the Avenue Montaigne and the Cours-la-Reine, near the Place de l'Alma—and at the moderate rent of 15 francs per square metre for the period the International Exhibition is to be open. M. RODIN has given instructions to M. MARCEL to prepare plans of the building; but since M. RODIN has been successful in his application, why should not other artists, painters as well as sculptors, apply for a similar privilege?

THE hill of Tara, on which Irish kings were crowned, and where the petty monarch used to hold conclave down to the sixth century, appears to have had legendary interest in a still more remote age. Now that prehistoric archæology is being systematised it is no wonder that many explorers are anxious to operate on the various earthworks which are found upon the famous hill. The genuine Lia Fail, or Stone of Destiny, which was used as the coronation stone, is believed to be still at Tara, the stone at Westminster being an imposition. It will suggest how widespread is the belief in the treasures of the raths when we find the Secretary to the Treasury announcing on Tuesday that an English gentleman, in spite of all regulations to the contrary, has commenced excavations in the expectation of discovering the Ark of the Covenant. That is not the only treasure which imagination believes to exist within the deserted hill, from which the glory vanished after St. RUADAN of Lorha cursed it in A.D. 563. Fortunately Tara is officially recognised as an historic monument, and is under the protection of the Irish Commissioners of Public Works. At their instance the operations were suspended, and the ark, if existing there, can enjoy another long spell of repose. On several occasions the interference of the board has saved the raths, and, on the whole, it may be wiser to prohibit inquiry, for excavations might be followed by disillusionising.

THE restoration, or rather completion, of Cologne Cathedral was one of the causes which led to the creation of the German Empire. Many writers in the early part of the century advocated the work on that ground. It was not easy to obtain co-operation between the various States, but the building offered an occasion which could not be neglected. The cathedral was taken to be the crowning effort of German architects, and the whole Fatherland could aid in realising the intention of the designer without any sacrifice of particular interests. Subscriptions were therefore invited from all lovers of German art, and the response was worthy of the object. The blessing which followed should inspire liberality in aiding funds for restoration. In 1824 the work began, and it has been conducted under three architects—AHLERT, ZWIRNER and VOIGTEL. The outlay, according to the last report, has exceeded a million sterling, but in a political sense the result was worth the money. The estimated expense was a quarter of a million less, but with so vast a building an approximation was the most that was to be expected. Writing in 1820, WORDSWORTH appeared to think there was no possibility of completion without the help of angels, and that so much is realised is creditable to the patriotism of the Germans. If some among them are disappointed, we suppose that is an inevitable consequence of the combination of old and new work, and is not confined o building.

NOT many years have elapsed since the name of VELASQUEZ was almost unknown in this country. It was found necessary to have one of his works painted up by GEORGE LANCE, the fruit painter, before it could be offered for sale in London. England, however, did not differ much from other countries, and the Spaniards were not very enthusiastic about the genius of their great countryman. With the rise of realism in literature VELASQUEZ could not remain in oblivion. He also sought to be natural. Although his faces and figures might be declared to be ugly, he cast the responsibility on Mother Nature, who should know what she was about in her creations. He is now a power which is exercising an influence on English and on French art, and it was right that the Royal Academy should be represented at the celebrations in Madrid. Sir EDWARD POYNTER'S own style differs greatly from the Spaniard's, but he rendered justice to the great artist. At the unveiling of the statue he said he attended on behalf of the Royal Academy and the artists of Great Britain to offer a wreath in homage of the genius of VELASQUEZ. "It had been said," continued the President, "that a work of art was of no country, or rather that it was the common inheritance of all countries alike; nevertheless it could not but be a legitimate source of pride to the Spanish people that the greatest master of the brush that the world had seen should have been of Spanish origin, and that he owed nothing to the example of other schools, but all to his individual character as a Spaniard, and that, in spite of his two visits to Italy, then considered the leading school of the world, he was able to preserve his originality and his nationality to the end of his life. He himself had the right to speak only in the name of the artists of his own country, and his presence there was a mark of the respect, the friendship and the sympathy which they bore not only to the genius of VELASQUEZ, but to the Spanish nation." The words were apt and will be approved in England.

FOR some time past little has been said about the great work by M. DALOU, the sculptor, and which is to be erected in the Place du Trône, a position which is too remote from the centre of Paris for so important an example of the sculptor's art. It may be remembered that the *Triomphe de la République* represents a car with a figure of France and symbolic attendants. A plaster cast of the groups was set up for one of the national fêtes, and excited general admiration. In the interval the casting of the different pieces has been in progress, and it has been arranged that the memorial will be fixed and inaugurated by September 22, which by the Convention was decreed to be the opening day of the first year of the Republic. Several of the pieces have been sent from the founders to the Place du Trône. The question now arises, Will the connections be carried out before the public? To conceal the operations would need the erection of a large and unusually expensive temporary structure. It has yet to be settled whether the Municipal Council will agree to expend the sum required. Students of art would be likely to gain if the whole process was exhibited to them.

THE appearance of new editions of MURRAY'S Handbooks suggests the holiday season. One for Somerset is this year's pioneer. It formed a part of a volume, but now it has an independent existence. The parts relating to archæology and architecture are treated with particular care, and visitors can accept the guide as trustworthy. Geology is also well presented. As a whole the volume is up to date, while suggesting whatever was interesting in the history of a county where the importance of architecture was duly recognised.

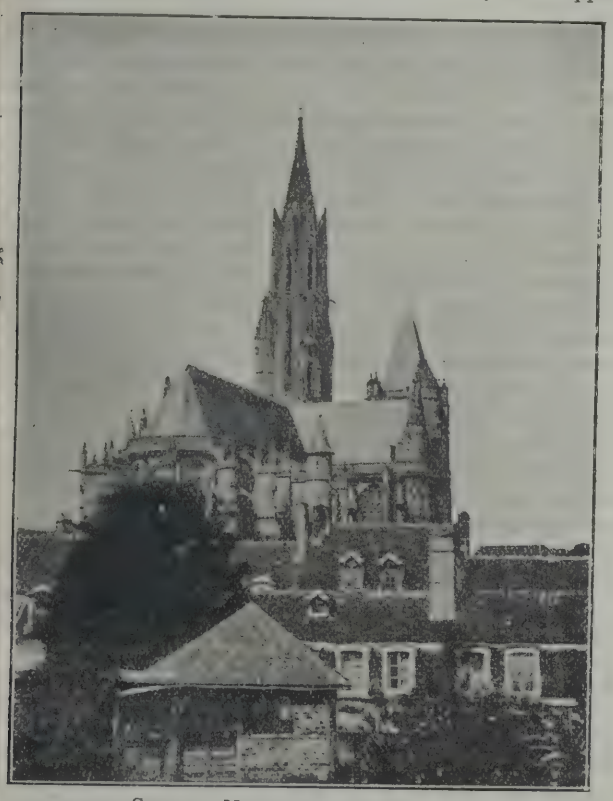
XXIV.



Beauvais to Creil and Senlis.

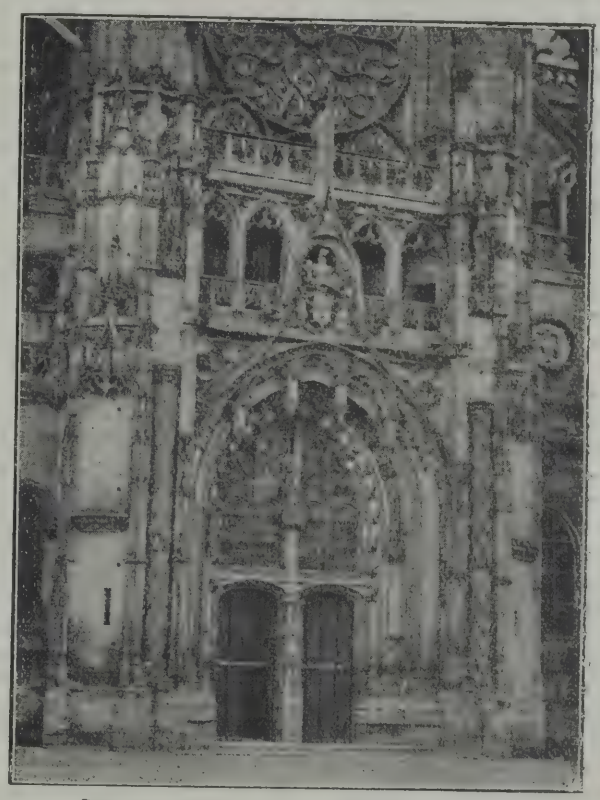
THERE is but little to interest the architectural student on the line of railway between Beauvais and Creil until the station of Cires-les-Mello is reached. But he who is not tied for time or encumbered with luggage may derive much enjoyment from a leisurely journey between the two places by taking the train from Beauvais, alighting at the next station, dawdling away an hour or so in studying Picardian village life, then walking on for a distance to catch the train at another village station, and so on.

Cires and Mello, the contiguous villages above alluded to, is each graced by a fine First Pointed church. We will first take that of Mello, which lies to the left of the railway as Creil is approached.

This church is quite a cathedral in miniature, very short but very lofty, with a nave of only two bays, transepts and choir, seriously encroached upon by some architect of the Flamboyant, and in a heartless sort of manner that is apt to become tiresome in France.

Externally the church at Mello presents a very noble appear-

SENLIS: NOTRE DAME FROM N.E.



ice, its clerestory of tall two-light windows with very rudimentary foliated tracery being majestically set off by flying buttresses. he south porch is of exquisite beauty, and the view across the ort, lofty church from its inner portal is highly impressive. rom the crux rises a light, slate-covered flèche.

Of the interior detail, the most noticeable is a bead mould- g carried round the bases of the columns; but here, as almost iversally in France, we are confronted by a coldness arising iefly from that want of taste (unfortunately too common in ance) in the furniture of the sanctuary. A piece of tapestry sts no more than gaudy painting, and it is to the presence these rich stuffs that our Anglo-Catholic altars and their rroundings owe that warmth one vainly looks for in the ctuaries of some of the largest and most magnificent French urches. Since the great revival in England of matters eccle- stical, perhaps no branch of the art has been taken up with eater enthusiasm, or has been attended with such felicitous ults, as the adornment of our altars with antependia, dossal d side hangings, whose enrichment bespeaks the skilful use the needle.

It is surprising to find two contiguous French village churches of such dignity and rare architectural interest as Mello and Cires. The latter, which lies to the right of the line, is less aspiring, but has, I think, more repose. Here I especially noted the fine First Pointed west front, with a porch between its deeply projecting buttresses, and whose outer arch assumes that peculiar equilateral form observable in the north transept of Hereford Cathedral. The inner arch has rich mouldings on tripled shafts, and within a niche in the tympanum the legend of St. Martin and the beggar is sculptured.

A small Late Gothic tower, with hipped gabled roof of slate, flanks the front to the south. Just behind it is another graceful but very narrow First Pointed porch. Flying buttresses give an air of great importance to the external ensemble of this church at Cires, but of the clerestory windows on the northern side nothing can be seen below the spring of their arches. They consist of three lancets within a containing arch, the lower part being overlapped by the lean-to roof.

Within, it was delightful to find a nave arcade of much grace, its low cylindrical piers having angle shafts and delicately-foliaged caps, but whose lower part is unfortunately concealed by wainscot commensurate with the height of the closed pews with which the nave is filled. The original chancel appears to have been replaced by one of debased character

SENLIS: SOUTH PORTAL OF NOTRE DAME.

and mean dimensions, with a low arch opening into it and the superimposed wall space occupied by a large crucifix, which at the evening hour of my visit to this church the sun was gilding with an effect of great solemnity. But, despite the loss of its choir, there is great picturesqueness in the interior of Cires Church, and this is enhanced by the descent of several steps into the nave from the west and south doors.

The parish church of St. Medard at Creil, although exteriorly somewhat uncouth in ensemble, will amply repay a visit, abounding as it does in thirteenth-century detail of the chastest description. The whole interior is most picturesque. A low, cavernous-looking nave, seated with open-backed benches, efflorescing into a choir, likewise unclerestoried, but much more elegantly proportioned, and belonging, as it does, to the best age of St. Louis, seemed of a local type, similar choirs rising at the end of more humbly-dimensioned naves at the neighbouring churches of Royaumont and Nogent-les-Vierges.

Additional piquancy is lent to the internal ensemble of Creil Church by the obliquity of its eastern wall, sufficient to

admit of three bays on the north side of the choir, whereas the opposite one has but two.

There is a noble Early Pointed western doorway, its mouldings rising from five shafts on either side, but the vault of the porch has disappeared. The tower, of a plain late character but good, has a low crocketed spire, which, together with the high choir, seemed to be a favourite localism.

After a morning spent in Creil for the purpose of visiting a few village churches in its vicinity I had a delightful walk of about seven miles to Senlis, where I was rewarded not only by the beautiful little quondam cathedral of Notre-Dame, but by two other desecrated churches of little inferior interest.

Notre-Dame at Senlis is one of a grand series of buildings, including such examples as the apse of St. Denis, the choir of Notre-Dame, Paris, the cathedrals of Noyon and Sens, the churches of Pontigny, St. Remi at Rheims, Notre-Dame at Châlons, Mantes, and St. Leu d'Esserent, whose erection, spread over the latter half of the twelfth century, was the outcome of that great burst of enthusiasm for church building which, keeping steadily on during the first half of the thirteenth, culminated in the choirs of Amiens and Rheims, the portals of Chartres, the Sainte-Chapelle, St. Urbain at Troyes and a host of others.

But so completely have sixteenth-century additions and superimpositions altered the original ground plan and character of Senlis Cathedral externally, that at a first glance, and more especially if approached from the south, it would be pronounced an erection of the Flamboyant epoch, four of the apsidal chapels and the western façade being now all that can be seen outside of the original twelfth-thirteenth century church.

Once, however, through the rich sixteenth-century portal of the south transept, one of the best works of its age and class, the grace and refinement of this small but most delightful of Early French Gothic cathedrals comes as a glad surprise to the admirer of traditional Northern Pointed.

The nave, whose curtailment was due to want of funds, has but five bays, the most westernly of which is comprised in the space between the towers; the choir, which terminates in a five-sided apse, has six bays, the transepts two apiece.

Counting from the east, the first two arches on either side of the nave spring from an isolated column. The next, very narrow and stilted, has attached half-columns; the fourth is similar but somewhat wider, and the most westernly is concealed by a heavy stone arch thrown across the nave to support the organ. Throughout the church the triforium consists of a Pointed arch corresponding in width with the bay below. In the nave and transepts Flamboyant balustrades have been inserted within these arches, productive from certain points of remarkably beautiful effects. This triforium at Senlis, which, like those of Noyon and Laon, assumes a feature of great importance, is vaulted, and should be traversed by the visitor desirous of seeing what the plan of the church was like before it was struck by lightning in 1502. To this accident the late character of the clerestory and vaulting of the whole building is due. The Flamboyant vault, with its ribs dying off into the immense shafts without the intervention of capitals, is remarkably good, as is the Early Pointed vault of the aisles and beneath the western towers. The view from the west end of the south aisle should be especially noticed, the bend of the procession path in the distance having quite a Canterburian air. In the Flamboyant chapels opening out of this aisle the Perpendicularising tracery of the windows and the large pendant bosses form remarkable features. The northern aisle of the nave, of thirteenth-century date, opens into a wide Flamboyant one with very fine bosses, one of which, representing a crown upheld by angels, is of especial richness and elaboration; while from the summit of a flight of steps at the western end of this outer aisle a truly delightful view of almost the entire interior can be obtained. In the two lower stages of its elevation the eastern side of the north transept exhibits early thirteenth-century work, the tribunes being lighted by six foliated circlets, and with happy effect. On the western side the arcades are sixteenth-century work, but the First Pointed tribunes remain. Of the opposite transept the western side is entirely sixteenth century, as is the principal face of each arm with its graceful rose window. In the southern one is heavy painted glass, blue preponderating; the northern has not yet received its complement of vitreous decoration. The choir, quite a gem of the Transitional period, is of six bays, the first of which on either hand has its arch resting upon attached shafts, the remaining bays being arranged in pairs between the vaulting shafts and springing from isolated columns with nobly foliaged caps. The same type of cylindrical column does duty in the graceful five-sided apse, whose ensemble as far as the spring of the clerestory recalls Mantes. As in the nave, the whole of the clerestory is sixteenth-century work, but the Flamboyant railing to the tribunes does not appear in this portion of the church.

From the choir aisle and procession path chapels radiate. Of these, the two on either side the lady chapel, which is a very jejune Middle Pointed work, are very shallow semicircular projections retaining their original fenestration, while the remainder are rectangular, with window openings in various phases of Middle Pointed. Of these the most beautiful examples occur in the first two chapels opening out of the northern aisle. In that dedicated to St. Catherine, forming the eastern aisle of the transept, the window lighting its northern end has three unfoliated compartments, with, in the head, a large trefoil, and some modern glass of excellent character representing scenes in the life of its titular saint.

The next chapel opens into the aisle by two bays corresponding to those of the choir, and has a pair of lovely Early Middle Pointed windows, the three trefoils with which each is traceried being without containing circles.

None of the other projections contain anything very remarkable until the last but one in the south aisle is reached, its wall being pierced with an ogee-headed and crocketed doorway conducting to the sacristies. The baptismal chapel, in rich good Flamboyant with large pendant bosses, is formed in the eastern aisle of the south transept.

It was about six o'clock when I first entered this smallest but most enchanting of northern French cathedrals, and so fascinated was I with its interior that ere I had closed the door of the south transept upon such a combination of attractions, the simple, solemn First Pointed western façade—one of the earliest of its class, I believe, with an exquisite central portal flanked by effigies and having in its tympanum a sculptured Coronation of the Virgin—was glowing like old gold in the gorgeous sunset.

Viewing the steeple which rises at the south side of this façade at Senlis, it is impossible to extol too highly the consummate skill with which the eye is conducted from the square to the octagonal portion of the tower, and thence to the slope of the spire. This is effected principally by concealing with open tourelles (somewhat after the style of Laon, Naumburg and Bamberg) the oblique sides of the octagon, the canopies of the said tourelles leaning against its sides. Then the beautiful pyramidal character of the steeple is further strengthened by a tall squinch, of which one with its gablet is placed against each side of the spire. Such an arrangement, of course, appears to decrease the true dimensions of the spire, but is only another factor in endowing it with an air of grace perhaps unsurpassed by any contemporary erection of the kind. Seen in profile under certain conditions of light and atmosphere from the boulevards on the north side of the city, this spire of Senlis, pierced at judicious intervals as to its scaled surface, and crocketed as to its ribs, looks like Strasburg in miniature.

Of Senlis' desecrated churches, the most beautiful, that of St. Frambourg, is now a carriage depository. The details of its western doorway are truly exquisite specimens of floral sculpture—nothing more vigorous or beautiful can be imagined. The plan of this church—a First Pointed one, without aisles and having very large lancet windows most gracefully shafted—is simply a parallelogram terminating in an apse, whose semicircular sweep with its red-tiled roofing helped on the following morning to compose a picture truly enchanting, standing out as it did against a sky of purest blue.

A cool ramble about the quaint streets of Senlis, and a prolonged saunter upon its old fortifications, from which at one point the spire of Notre-Dame and that of another gracefully contoured, hipped-gabled one belonging to St. Vincent's could be taken into one view silhouetted against the calm evening sky, completed a very pleasant reconnoitre.

(To be continued.)

COLOUR IN ARCHITECTURE.

IN studying the use and value of colour, writes Mr. A. A. Cox in the *American Architect*, it will, perhaps, be pertinent first to distinguish between paint and light.

We see objects by means of the light which is reflected from them to our eyes, and we distinguish between objects by means of the arrangement and the kind of light-rays. It is the latter phase, the kind of light, that is here considered, these variations in kind being called "colours."

When an object looks of a "green colour" it is because that object reflects green light to the eyes. If white light strikes the green object all the light except green is absorbed.

Colours are divided into warm and cool shades. Light colours make an object seem much larger than it would appear if full tones were used. A familiar example of this may be seen when one compares one's feet when dressed first in white and then in black shoes. Colours spread or diffuse, so that when two are adjoining they affect one another in appearance.

Colours are divided into classes, which variations are called "shades," and there are modifications also of these shades. If a shade has an extra amount of white in it, making it a lighter shade, it is called a "tint," and if there is less white in a shade it is called a "tone." As there are, therefore, any number of variations of shades, tints and tones, there are innumerable colour combinations. For general work of decoration a full shade is seldom used, it being nearly always preferable for colour schemes to be composed of tints or tones. Because of surface reflection, a very strong light throws back some of the white with the real colour of the surface and in this way a full shade is made a tint, that is, the colour seems lighter in appearance. For this reason the Egyptians and Greeks in their bright sunshine used the full red, blue and green shades.

In speaking of combinations, emphasis must be placed on the fact that pure mixings of light rays as compared with mixings of paint are quite different.

The Uses of Colour.—We are frequently hearing the question, "What is the use of colour?" And the answer almost quite as frequently echoes, "No use." This, however, is not exactly true, for even if colour gave satisfaction and pleasure to the eyes only, it would be sufficient to prove its usefulness in the present day quite as much as in the earlier ages of history.

Colour assists in distinguishing forms in an artistic manner, which cannot be equalled by line-drawings, however carefully the latter may be executed. For example, take an engraving or etching of a landscape; the lines necessary for portraying the different planes in the picture are varied in their degree of depth to assist in producing distance. The distant effects so gained, however, are not always produced by the mere lines only, but are due to the relative grades or intensity of the colour used in the lines, be it black, brown, or any other monochrome, or to their being drawn in closer or wider proximity to one another, so that alternating with the white or other local colour of the ground-spaces of the picture they produce at distances the desired degrees of tone, the result being derived as much from the gradation and spacing of the lines as from the actual lines themselves. Such pictures, if executed in coloured lines viewed from a distance, often give to an inexperienced eye the same effect as monochrome pictures.

Examples of the manner of denoting colours by lines (instead of brush-work), *i.e.* scoring or crossing of lines, are to be found in heraldic designs; escutcheons are frequently scored, some with single parallel lines and others chequered with squares or crossed diagonally, either of which methods gives an appearance of colour to the whole surface.

The colours in flowers serve, perhaps, no real purpose beyond pleasing the eye of persons generally, but the gardener finds the colours most useful when laying out his grounds and for other floral effects he may wish to produce, by the introduction of the various colours found in his plants. If all flowers were of the same hue we should soon weary of the monotony; the various forms of foliage, while being beautiful in themselves, would lack in usefulness, which fact would prove again the use of colour in flowers as decorative objects. The use of colour, therefore, in natural plants being apparent, much more so is it when plants and flowers are made the "motif" for decorative designs in wall-paper hangings, whether in a conventional or realistic form, also in decorative china and porcelain, tapestries and many other art objects into which flowers can be introduced as decorative features. It would be hard to imagine the earth deprived of its varied tints of verdure and the trees all of one shade of colour.

Colour, therefore, pervading the world in its variety of shades and forms, is a natural creation, and it is generally admitted that all natural creations are more or less useful. The history of the world (not only the written history, but what may be termed the material history, or, in other words, the ornaments of the early ages which from time to time are being discovered) goes to show that as soon as the absolute necessities of life and shelter had been supplied, the next efforts were to beautify them by use of colours.

In the ruder conditions of man the desire for the primary or positive colours was most marked, and in relative proportion to the civilisation of man the use of colours became more refined and brought into harmony with the cultivated tastes of the various tribes and nationalities. From the earliest up to the present day colours have been most useful in the army and navy as distinguishing marks of the different nations. Also in ecclesiastical and collegiate orders their use is asserted to a large extent. Imagine a college without its "colours" or the church ritual without its embellishments.

Coming down to the domestic sphere, every habitation, from the smallest hut to the most palatial residence, has in some form or another an application of colour. Colouring gives repose to the eye when shadings and shadows are, as in nature, used in true contrast to the lights, and produces the rule for harmony. Examples of neglect of such harmony may frequently be seen in our modern domestic dwellings. For example, it will be found that rooms with north lights are often decorated with ornaments shaded in greys or cold colours, whereas warm shadings should be used, and *vice versâ* rooms with sunny aspects as a rule should be treated with cool shadings. The choice depends, however, considerably upon the source of the light in the room, whether from direct or reflected rays. The artist will at once see and adapt his colour-decoration to the peculiarity of the situation. The above remarks, however, are worthy of remembrance by those unfamiliar with the art of painting and decorating.

The elements, then, or natural forces by which colours are produced, are the positive and negative principles of light and darkness, these elements being represented by white and black from the elementary colours. Between these two colours exists an indefinite gradation of shades, which are termed "tints" and "tones." All the elementary and compound hues and colours may be generated by the scale termed "chromatics." For example, a spot of any shade or colour on a ground lighter or darker than itself, being viewed through a prismatic lens, will be reflected by the refraction of light and shade into an orb of three colours, these three colours being termed "blue," "red" and yellow," which are incapable of being produced by composition, or of being resolved into other colours by analysis, and are simple, primary colours elicited by the electrical excitement or concurrence of the light and shade of the ground and spot of colour. Accordingly, if the ground and spot of colour be changed from light to dark, or from white to black, the same process with the prismatic lens will produce the same relative colours, differing only in the inversion of their arrangement, being the order of the colours in the rainbow.

This evolution of colours or polar principles of light and darkness is a simple act of nature, which gives us the first order of colours in the sequence of their relation to white and black, and it is the constant law of chromatics by which all the relations of colour are determined.

The Order of Colours.—Colours are of three classes: primary, secondary and tertiary. Any two of the primaries mixed in proper proportions will produce a perfect secondary which will harmonise with the remaining primary, *e.g.* yellow and blue mixed together form green and will harmonise with red. Red and yellow will produce orange and will harmonise with blue. Blue and red will form purple and will harmonise with yellow. Likewise the alternating of these secondary colours and mixing them in pairs will produce the third class of colours. Thus if orange colour be mixed with green they will produce a citron colour; if purple be mixed with orange they will form russet, and if green and purple be mixed they will give olive colour.

Admixtures of these colours produce the varieties of shades and tints by which nature is decorated, and which predominate in all works of an artistic nature. By an indefinite or disproportionate mixture of the three colours of either class or of the whole together we derive the hues usually termed "brown." The browns are also a very valuable and useful class of colour for producing warm tones in a picture, as also are the greys for affording cool effects, being the contrary of brown.

The primary colours may, however, be materially changed by admixtures; by mixing them in varied proportions many different hues or tints are produced. It is seldom, however, if at all, that the pigments used by the artist or decorator are the perfect representations of the primaries. For instance, there is practically no yellow pigment in use which can be said to be free from a small trace of red or blue, no red that is really free from a slight admixture of yellow or blue and no blue without a small proportion of red; and in consequence it follows that no secondary colour can therefore be perfect, but will approach perfection just in the same ratio as the adulteration exists in the primaries—the adulterations arising from chemical impurities and differences of transparency or opacity.

The Secondary Colours.—Orange is the first of the secondary colours in relation to light. It is an advancing colour in painting and decoration, and in nature it is effective at a great distance, acting powerfully on the eye. A true or perfect orange is such a compound of red and yellow as will neutralise a

perfect blue in equal quantity either of surface or intensity. It forms a series of warm semi-neutral colours with black, and harmonises in contact with a variety of tints and with white. It is a warm colour and also discordant when standing alone with yellow or with red unresolved by their proper contrasts, or with any pigment having an inflammable basis, for with all such it occasions changes in colour by becoming dark or by fading the colours with which it is mixed.

The practical uses of the primary, secondary and tertiary colours are as follows :—

1. *Yellow* is the first primary ; it has the power of reflecting light, and is a most advancing colour. As a pigment it is a tender, delicate colour and easily spoiled by other colours. In painting it diminishes the power of the eye by its action in a strong light, but in a declining or weak light it aids vision and becomes more distinct as a colour. Of all colours except white it contrasts black most powerfully.

2. *Red* is the second primary colour ; it is pre-eminent among colours, and is the most positive of all. It affords warmth to all colours, but mostly to those which partake of yellow, and is the second power in harmonising and contrasting other colours, and in compounding black and all neutrals. Mixed with yellow it becomes warm and advancing, but if combined with blue it is cool and retiring. These qualities of red give it great importance in decoration, and render it difficult of management. In nature red is used very sparingly, and in practice likewise it should be used with discretion. Red diffuses with white, but it is discordant when used with orange alone. It is powerful and cheering and cannot be composed by mixtures of other colours. In China red colour is consecrated to religion, owing perhaps to its being one of the most beautiful colours in nature.

3. *Blue* is the third primary. It bears the same relation to shade that yellow does to light ; hence it is a most diffusing and retiring colour, and is the only colour that alone possesses what is termed "colourness" in colouring. It is powerful in a strong light, but is weakened very perceptibly by a declining light, and becomes neutral and pale, owing to its affinity to black or shade and its power of absorbing light. Blue is discordant when placed in conjunction with green and in a less degree with purple, both of which are cool colours. It should always be used in a proper proportion with its contrasting colour, orange, which would have a tendency to correct its coldness. In botany we see fewer flowers of a blue colour than any other of the primaries and their compounds. Blue flowers can be changed by cultivation into red and white, but never into yellow, as also, to the contrary, yellow flowers are readily converted into red and white but never into blue, and likewise red flowers are changeable into orange and purple but never into blue or yellow. Blue is universally agreeable to the eye when used in due relation and proportion to the composition, and may be more frequently repeated in a colour-scheme or picture than almost any of the other primaries, and it cannot be composed by mixtures of any other colours.

The use of colour and the art of applying it to decorate or embellish documents appears to have had its origin in the East. The Egyptians were in the habit of rubricating their manuscripts, as also were the Greeks and Romans, although little evidence exists in either country previous to the Christian era.

Towards the end of the fourth century this mode of decoration was more frequent. Examples dating from the fifth century are to be seen in the British Museum, the colours predominating being bright purple or rose colour. In the eighth and ninth centuries the art of staining vellum appeared to decline, and the colours used were less pronounced. Manuscripts written in letters of gold on white vellum are chiefly works of the eighth, ninth and tenth centuries. Writing in gold was less employed in the eleventh, twelfth and thirteenth centuries than in earlier times, but it again came into use in the fourteenth century, particularly in devotional books and with persons of rank.

From the eighth to the eleventh century occur in the Greek and Latin manuscripts initial letters of large size at the beginning of books and chapters, principally composed of human figures, animals, birds, fish, flowers, &c., all in colour, the chief features of the ornaments and letter being the extreme intricacy of pattern: interlacings of knots in a diagonal or square form, sometimes interwoven with animals and terminations in heads of serpents or birds, to which was added the use of red dotted lines round the edges of the larger letters. The lizard, from the facility with which its graceful form could be made to harmonise with every variety of curve, seems (under various conventional modes of treatment) to have been the favourite reptile introduced in all kinds of ornamental design during the whole period of the Middle Ages, but at no time so profusely as during the twelfth century, when the colouring of these initial letters was of a simple character. The outlines were usually red, the foliage and figures without colour, but relieved by having the intervening spaces picked out with various tints. In the more elaborate examples the letter in its ordinary form was represented in burnished gold and the foliage and other accessories by which it was surrounded and interlaced formed a mass of the most varied and gorgeous colours, brought into harmony with one another by the admirable taste shown in their arrangement, the letters and all the details being outlined in a strong colour.

In the thirteenth century a new character was given to illuminating. The larger letters, composed chiefly of scroll-work, became more intricate and lost, in minuteness of style and over-elaboration, the boldness of character and simplicity of treatment of the preceding age. In the smaller initials figures were more abundantly employed, and groups representing the leading facts in the volumes themselves were frequently given within the circumference of the letters.

During the fourteenth century the same character continued to pervade illuminated letters and pictures, but in the fifteenth century immense strides were made ; the conventional treatment began sensibly to decline and an almost endless variety of examples, both in design and colouring, are to be seen in the manuscript records of that period. The ornaments and letters were in a totally different taste from those of the earlier dates. Nature was again studied, and in lieu of grotesque figures flowers of every hue were introduced, fruits, birds and insects most delicately and minutely coloured upon gold grounds, with a perfection of execution and taste. It was, however, in the sixteenth century that the highest degree of excellence was accomplished. The examples of this period seem to combine all the refinement of Italian art in composition and colouring, with a delicacy of execution to be found only in the Persian and other Eastern manuscripts.

The French, German and Flemish illuminations, though different in character, were but little behind those of their Italian rivals in point of merit ; but in England the art declined from the latter part of the fifteenth century owing to the general employment of foreigners.

For a century after the invention of printing the art of illuminating made steady progress, but from that time it began to gradually decline, and although it existed as late as the seventeenth century it was rarely practised, and was almost entirely confined to religious books.

The use of colours and methods of the application of them to the various forms of architecture was well understood by the Egyptians and by the Greeks. The Romans, on the other hand, diminished the use of colour, and adapted marble and stone to the surfaces of the buildings, although they applied highly effective decorative paintings to flat surfaces of plastered walls, &c. Turning to Christian art, we find an intimate union between colour-decoration and architecture, and can trace it all through the important works of the Middle Ages. The object of using colour painting was to obtain richness and uniformity of effect in such parts of the Byzantine churches as were not constructed of marbles or mosaics.

The colours principally used by the Egyptians were red, blue, yellow, with black and white to give distinctiveness to the various tints, and green used generally as a local colour, the formation of their designs being of a geometrical character and symmetrical of arrangement, the lotus and papyrus from the banks of the river supplying the idea for all their colour-decoration.

The Greeks borrowed their colour ideas partly from the Egyptians and Assyrians, and rose rapidly to a state of perfection in colour decoration. The honeysuckle was a favourite ornament, and is found in a variety of very pleasing forms on old Greek vases ; each leaf seems to have been executed with a single stroke of the brush.

In the Byzantine period coloured ornaments are distinguished by broad-toothed and acute-pointed leaves, and almost always finished in gold. Very profuse geometrical designs are found in this style.

The Romanesque style of architecture was peculiarly adapted to colour-decoration ; the mouldings, pillars and capitals were painted with appropriate patterns. During the Middle Ages the interiors of the poorest as well as the richest buildings were treated in colour.

Very little is known of colour-decoration in England, so far as modes of application, prior to the Saxon period, but there is little doubt that some skilled work was executed at that time, some interesting examples of the Saxon and Norman periods remaining to be seen in various cathedrals. Peterborough affords some very fine examples of the latter period. There is a similarity between the decorative colour-work of the twelfth century and the illuminated manuscripts of the same period, to which I referred in the earlier part of this essay.

In France, prior to the time of Charlemagne, decorative painting as applied to architecture was very simple in treatment.

All colour-decoration, to be effective, must be flat ; in other words, must not be worked in shades to produce relief or shade lined. It is permissible to use gradations of colour, but even then only in a conventional form, without any definite lines of light and without any shadows. Flat painting requires a peculiar treatment, both in regard to colouring and drawing, especially if it be intended to follow the various periods of the

Middle Ages. Then forms and figures must be rendered with sharply-defined outlines. When two light colours are used together they should always be separated by black or dark lines, and when dark or rich colours are used light separating lines are necessary. The colours must be selected in reference to the position they will occupy, and their depth of tone graduated accordingly; also as to the distance from the eye and amount of light received, great care must be exercised in choice of tints. In the best examples the ornamentation is kept as much as possible subordinate to the architectural forms of the buildings.

A few words upon the use and appliation of colour when executed by stencilling may, perhaps, be acceptable. For ordinary work of large details tough brown paper, highly rolled and well painted and shellaced or varnished on both sides, is used for the stencil-plate, the design being cut accurately with a sharp instrument. In case of very delicate designs, tint-plates may be used with advantage. The colours are then applied to the walls over the stencil-plate in the necessary colours called for in the design; the brush should be used as much as possible in the direction of the design in applying colours by freehand work: in flowers, from their centres towards their edges; in leaves, from stems to their points, or from their main rib to edges. In scrolls the brush should follow the curves. Broken colour is valuable in hand-painted work, as well as in stencilling. It will always be found advantageous n colour-decoration to avoid the use of bright, crude colouring. Chrome-yellow, vermilion and ultramarine, orange-chrome and emerald-green should be used very sparingly. The safer yellows are the various ochres, especially Oxford ochre, which produces a beautiful quiet tint in combination with white and other pigments. In the class of reds, Indian and Venetian reds with ochre produce quiet colours of great value. Ochre, also, with Prussian and other shades of blue, supply us with some excellent greens. All greens used for decorative work should be, as a rule, composed of blues and yellows, and not be the ordinary green colours of commerce.

To fully describe the value of colour would occupy too many pages. It will, however, suffice to mention a few of the numerous ways in which it may be realised. In almost everything that we see around us in nature or architecture, painting, sculpture, and, in fact, in all the arts, we find colour predominating in a greater or less degree, and without which many of the greatest masterpieces would fall into insignificance. Looking to nature we find it in multitudinous forms. In architecture it is ever present. In the early ages colour was introduced into terra-cotta in a variety of shades, the value of the tints being readily recognised and appreciated by the Egyptians, as illustrated by the examples of pottery which have been discovered from time to time. Bricks and terra-cotta are perhaps the two most useful articles for supplying colour as a permanent decoration for buildings at a reasonable cost. Of course, marbles and granites and the great variety of stones all more or less derive their value from their natural colouring, but being more expensive, are not used in so many ways as terra-cotta. Each stone quarry furnishes us with a colour peculiar to itself; one formation furnishes red, another yellow or buff, another green or blue, and so on, each in itself being selected for its particular tint. They are often used together in various constructions, and some very fine decorative effects are thus obtained. Mr. Ruskin in his "Stones of Venice" furnishes us with some remarkably fine examples of colour-decoration in the form of stone and brickwork.

Previous to the use of stained-glass the windows of churches had stone shutters or were filled with talc or alabaster. The windows in the apse of the church of San Miniato, at Florence, erected in 1008, are each filled with a slab of alabaster, which, when illuminated by the sun, admits of a cloudy roseate light. Immediately that glass was used for windows the opportunity it afforded for decoration suggested itself, and was freely taken advantage of. Specimens of work as far back as the twelfth century are still preserved, each example possessing a peculiarity of its own, and they are interesting as being early efforts in an art which in course of time attained such distinguished eminence, and was at length so completely identified with Christian architecture that no ecclesiastical structure was considered complete without having a free use of this transparent style of colour-decoration. The abbey church of St. Denis, in France, exhibits a perfect example of this decoration, dating from the beginning of the twelfth century.

The various resources of glass staining are equally suitable for the decoration of public buildings and private dwellings, affording a rich adornment for the windows of halls and stairways, and in many cases effectually screening objectionable sights. For these purposes simple and beautiful patterns of rich colours may be produced; figures, family events and ancestral achievements afford subjects for this kind of colour-decoration. All stained-glass should be so used that it harmonises thoroughly with the building in which it is placed. It should be correct in style, so coloured that the eye can rest upon it without offence or weariness; its figures should have a good flowing outline, well drawn, pure in form and well defined, not gaudy in colour, but quiet in general tone, relieved here and there by brighter colours in smaller pieces, so that a quiet and rich appearance may be realised in the deeper-coloured windows and in lighter ones purity and brilliancy, and in all cases conveying to the mind a sense of satisfaction and pleasure. Nearly 140 different tints of glass have been used in the production of a stained window. The fine old glass in Bruges and Chartres cathedrals was, however, composed of nine tints only.

Before closing this paper I will briefly touch the subject of domestic colour-decoration, and in doing so would quote Mr. Ruskin, where he says, "Whenever we leave nature we fall immeasurably beneath her," and "that the beautiful is true." The decoration of a home should be in harmony with the size and situation of the house and its surroundings. A good photograph is better than an inferior painting; a growing plant is better than a bunch of artificial flowers, and by striving to copy from nature we draw nearer to the infinite and to that which is "a joy for ever."

A home is a many-sided institution, and the influences which go out from it are subtle. Adornment need not necessarily mean an extravagant show; a beautiful house is not always made so by the largest outlay, for many an abode is made vulgar by the effort to show how much money could be put into the square foot of space. Tawdry colourings do not make a home which delights the eye or inspires the heart with the true sense of the beautiful. First to be considered is the comfort of the individuals of the household, and secondly, to educate and please the eye with suitable colour-decoration, harmony being the first requisite in our aim to copy nature's laws in the use of colour.

THE LIVERPOOL SCHOOL OF ARCHITECTURE.

AN interesting exhibition of work by students of the City of Liverpool School of Architecture and Applied Art was opened on Saturday at noon by the Lord Mayor in the Walker Art Gallery, in which accommodation has been provided for the purpose by the art and exhibitions committee of the Corporation. The school is comparatively young, nevertheless it has made rapid and gratifying progress. Its formation, says the *Courier*, was the result of persistent and praiseworthy efforts on the part of a prominent citizen who contributed so largely to the success of art in Liverpool, namely, the late Mr. P. H. Rathbone. In this work he was ably seconded by the authorities of University College, who established the school in connection with the university, and placed it under the direction of Professor Simpson, assisted by Mr. Allen as sculptor and Mr. M'Nairn as designer. The success of the scheme is attested by the annually increasing number of students. In the first year, 1894-95, there was an average of only fifty per term, but in the next year this had increased to 135, in the following year to 149; last year it was 158, while this year it has reached 175. There has been a corresponding advance in the class entries. Though in the first year they were only 70 per term, they now number 336. The collection consists of nearly 300 exhibits, and is altogether of a very encouraging character. It shows what may be done by students of the class for whom the school is intended; and bearing in mind the comparative youth of the school, it justifies high expectations of future success. Each section or studio is adequately represented, namely, architecture, sculpture, painting and drawing and decorative design, with which are associated the craft classes. Some designs in stained-glass are especially worthy of notice, particularly from the fact that the class for instruction in this kind of art was only commenced this year.

The Lord Mayor, in declaring the exhibition open, expressed his pleasure to hear that the work of the students was so creditable. The importance of the school had now evidently impressed itself on the minds of the people of Liverpool in an artistic sense. Though the school had only been established a few years, it had made gratifying progress, as the returns showed that the attendance of students had more than trebled. The proportion of class entries was also greater, and it was evident that the students worked with more regularity and joined a greater number of classes. The latter was a most encouraging feature of the work. It was important that those who joined should study more than one art or craft, inasmuch as by this means their minds were developed and expanded, and they were made altogether better and more intelligent workmen. During the last few years there had been a considerable accession of interest in this particular kind of education. In this direction Liverpool had not been behind any other part of the kingdom, either as regards the liberality of its city council or in the efficiency of its classes. This country, it must be admitted, had not yet got hold of the idea of instruction to the same extent as it was realised on the Continent, but efforts of this kind must commend themselves to all who took a practical view of education, because associated with the

crafts and industries which formed a large part of the life of the community, and it could not be doubted the effect would be to send into the world more efficient workmen and better fitted for the tremendous strain of competition in the present day. In conclusion, his lordship urged the desirability of efforts to enlarge the School of Architecture and Applied Art. He trusted one effect of the exhibition would be to lead those who had the management to afford Professor Simpson and his staff adequate accommodation for the important work they were doing.

Sir W. B. Forwood proposed a vote of thanks to the Lord Mayor. He remembered being present at the birth of this school, which emanated from the very fertile brain of the late Mr. P. H. Rathbone. Had Mr. Rathbone been present that day he would have been delighted at the great progress achieved.

Councillor Willink seconded the motion, which was unanimously adopted.

Principal Glazebrook moved a vote of thanks to Councillor John Lea, chairman of the arts and exhibitions sub-committee of the city council, for the assistance he had afforded in connection with the arrangements for holding the exhibition in the Walker Art Gallery, and for his valuable support of the art school generally. He pointed out that the students showed more and more their appreciation of the importance of the work by the number of classes they attended, and by the time and attention they devoted to their studies. They were coming in in large numbers from the right class of society, and every confidence was felt that the school by its influence would raise the level of art and applied art in the city, and would prove of great benefit to the community. The success already attained had been in a large measure due to wise leading and guidance, and in this respect they had to thank Mr. Lea and the other members of the committee for the aid they had rendered on various occasions.

Mr. Henry Hartley, in seconding the motion, remarked that with each term the number of art craftsmen increased, and there was being brought into the school the class of workers it was desirable especially to stimulate and improve.

The motion having been unanimously adopted,

Councillor Lea briefly replied. He said the arts and exhibitions sub-committee were particularly anxious to afford facilities for work of an educational character. While they did not profess to have—and the best friends of the school did not say they had—a perfect organisation, they were at least doing something in the right direction, and it was in the hope that the work in which they were engaged would be cordially promoted by the people of Liverpool that the exhibition had been held that day.

VENETIAN PAINTERS.

A LECTURE was delivered last week in the Manchester Art Museum, Ancoats, by Mr. T. Collins, curator, on "Venetian Painters." He said the arts have their origin always in some enthusiasm, as love, patriotism or religion. Each work of art sprang irresistibly from necessity. The Greek carved in marble with all his soul, in order that he might symbolise his gods. The Gothic cathedrals were built when the people and the builders were burning with zeal for their faith; love and fear laid every stone. The Madonnas of Raphael and Titian were made to be worshipped; they languished now because their purpose was merely exhibition. In Greece the Demos of Athens divided into political factions upon the merits of Phidias. Viewed from these points of view, the history of art became intelligible. We saw more clearly the force of Ruskin's words that "the art of a nation is the reflex of a nation's thought and feeling." After the conquests of Venice in the East during the thirteenth century a great stimulus was given to artistic development. Objects of art were brought from Constantinople with which to decorate their much-loved city. Towards the close of the fifteenth century Venice reached the summit of her power. Titian and Giorgione raised the standard of painting to its highest level. They were unsurpassed in technique and supreme in colour. Tintoretto and Paul Veronese share the glory of this, the brightest age of painting. The greatness of Titian dwarfs that of his master Bellini, just as Cimabue is overshadowed by his brilliant pupil Giotto. Titian begins an epoch in landscape painting; for the first time we have pictures relieved of the grotesque and the formalism of earlier painters, and here for the first time the word landscape was used. From the thirteenth century landscape painting had been struggling from occupying a secondary position to that of a first. The history of landscape painting may be roughly divided into three periods—Giottesque, Leonardesque and Titianesque. It was important to notice that the painters of the period used sacred subjects not as a means for religious devotion, but to show off their skill, and consequent loss of moral purpose. The first object of the earlier artists was truth and not beauty. Now it was beauty which all artists aspired to render, and not truth as their first object. This change was clearly seen by a glance at the works of Giotto, Angelico and Perugino. It was the result of a contest between beauty and truth, and beauty at the expense of truth triumphed. Tintoretto was for a very short time a pupil of Titian, but master and pupil quarrelled, and they parted company. Tintoretto, owing to the rapidity with which he worked, earned for himself the name of "Furioso." For a long time he suffered much at the hands of the partisans of Titian, and for some time was content to decorate the exteriors of cottages. The first impression, said Tintoretto, when judging pictures, should always be taken into account, as very often the highest beauty disappears upon an ensuing familiarity, and before seeing pictures that were newly exhibited intending visitors should wait until all the arrows of public criticism had been darted at them. Paul Veronese was probably the greatest decorative painter that ever lived. He was reputed to have been a very kindly and pious man; he often painted pictures without fee, as did Fra Angelico. "The Marriage Feast of Cana," now in the Louvre, brought him no more than 40*l.* of our money. It was said of him that while he had not the brilliance and depth of Titian or the prodigious facility of Tintoretto, yet he in some respects surpassed both. He painted sacred subjects as though they happened in his own day and city; every scene that he painted, lofty or humble, was invested with pomp and splendour. In "The Marriage Feast of Cana" we have a sumptuous hall of the richest architecture, lofty columns, long lines of marble balustrades rising against the sky, crowds of people gorgeously dressed, attended by slaves and pages, himself and Tintoretto playing the violoncello, while Titian plays the bass. The bride is supposed to be Eleanor of Austria. The lecture was illustrated by the museum collections.

HAMPTON COURT PALACE PICTURES.

IN consequence of the agitation against the removal of a number of pictures, including several of Raphael's cartoons, from Hampton Court Palace to Kensington Palace, the town clerk of Kingston wrote to Her Majesty's Office of Works inquiring whether such pictures had been removed permanently or merely temporarily, and also asked as to the number of the pictures so removed. To this a reply has been received from the Office of Works stating that the Corporation of Kingston are apparently not aware that the pictures at Hampton Court Palace are the property of the Sovereign, and are exhibited to the public at the pleasure of Her Majesty, who has exercised her right to add to or withdraw from the collection from time to time, and no question ever had been or ever could be raised as to the free exercise of this right. The general purposes committee of the Kingston Corporation have informed Her Majesty's Office of Works that their inquiries on the subject were made in no way whatever with a view to question the rights of Her Majesty in the matter.

TESSERÆ.

Thirteenth-Century Art.

ALL that is noble in modern art took its origin in the thirteenth century. Mind awoke from its paralysis, and step by step rapidly advanced in the development of its theoretic faculties. Knowledge kept pace with idea. Religion and patriotism stamped their image on progress. Art assumed the position of teacher; the people clapped their hands with joy as the new light broke in upon them. The mental movement throughout Europe was universal and sincere. It was a popular movement, and taking root in the hearts of the people, grew and flourished as art as a whole had never done before and has never since. It covered Europe with religious edifices of a character at once the reverence and despair of all after-time. To build as the Mediævalists built, we must feel as they felt. Every stone was laid in sincerity. There is no thought more apparent on these hoary stone records of a believing generation than the sincerity of the spirit which led to their erection. Pride of architecture and vanity of display came in with Renaissance sensualism, but Mediævalism stands in history the solitary exponent of the principle of labour for its true end—the development of the spirit. Hence its greatness. Practical knowledge was often wanting. But the people went to art as little children willing to be taught; she did teach and elevate them, and the people grew and flourished in spiritual truth until the reign of tyrants commenced, and sensualism blasted the fruit before it fully ripened. True it is that political wisdom was imperfectly understood, and civilisation in its most useful character of order was as yet undeveloped. Still commerce flourished, free cities multiplied, science spread, and all would have been well for the social fabric had the people understood the strength of union. Tyranny made them its servants through domestic discord. Aside from the social question, art in their hands was unquestionably lofty. Artists were ennobled in the public heart. They were both its leaders and its servants.

Runciman's Ossian Series.

A fire which broke out at Penscuik House, near Edinburgh, on Friday, damaged the paintings from Ossian by Runciman to such an extent as to make restoration impossible. The artist was the son of an architect who included the painting of ceilings among his professional duties. James Runciman studied painting in France and England, and practised in Rome for five years. On his return to Scotland he received a commission from Sir John Clerk for the decoration of the new mansion at Penicuik. The subjects were taken from Ossian. There were twelve principal paintings, representing some of the finest passages of the poems:—1. Ossian Singing to Malvina. "Daughter of the hand of snow, I was not so mournful and blind when Everallan loved me." 2. The Valour of Oscar. "Behold, they fall before my son, like the groves in the desert when an angry ghost rushes through night, and takes their green heads in his hand. Cairbar shrinks from Oscar's sword, and creeps in darkness behind his stone. He lifted up his spear in secret, and pierced my Oscar's side." 3. The Death of Oscar. "We saw Oscar on his shield; we saw his blood around—silence darkens every face; each turns his face and weeps—the king strives to hide his tears." 4. Death of Agandecca. "Bring hither, says Starno, Agandecca to her lovely king of Morven. She came with red eyes of tears—she came with her loose and raven locks: Starno pierced her side with steel—she fell like a wreath of snow which slides from the rocks of Ronan." 5. The Hunting of Catholda. "Many a hero came to woo the maid, the stately huntress of Termoth wild: but thou lookest careless from thy steps, high-bosomed Strina Donna." 6. The Finding of Corban Cargloss. "Who art thou, voice of night? said Fingal. She tremblingly turned away: a moonbeam glittered on a rock—in the midst stood a stately form, a swan with floating locks." 7. Golchossa mourning over Lamderg. "Three days she mourned beside her love." 8. Oina Morval. "In the hall I lay at night; soft music came to my ear; it was the Maid of Fuarfed wild, she raised the nightly song; for she knew that my soul was a stream that flowed at pleasant sounds." 9. Cormac attacking the Spirit of the Waters. "He rushed among the waves to find the son of the wind; three youths guide the bounding bark. He stood with the sword and shield. When the low-hung vapour past, he took it by the curling head, and searched its dark womb with his steel; the son of the wind forsook the air." 10. The Death of Cormac. "Why comest thou in thy arms to Temora, Cairbar of the gloomy brow? He passed on in his darkness, and seized the hand of the king. Cormac foresaw his death." 11. Scandinavian Wizards making Incantations. "Near is the circle of Loda with the stone of power, where spirits descend by night in dark-red streams of fire; there, mixed with the murmur of the waters, rose the voice of aged men; they call the forms of night to aid them in their war." 12. Fingal engaging the Spirit of Loda. "The spirit of Loda shrieked, as, rolled into himself, he rose upon the wind." The death of Agandecca was reckoned the best. It was commended for anatomical skill, as well as intrepidity of design.

The Mausoleum.

Mausolus, the eldest of the three sons of Hecatomnus, and the most wealthy and powerful prince of the Carian dynasty, died B.C. 353, after a reign of twenty-four years. His widow and sister, Artemisia, celebrated his memory by all the honours which the art and literature of the period could bestow. Contests for eloquence and poetry were instituted, in which Theodectes obtained the prize for his tragedy "Mausolus," and Isocrates was forced to concede the palm to his pupil in oratory, Theopompus. The Mausoleum—"the star-y-pointed pyramid," under which the body of Mausolus was deposited, was probably commenced during his life, as may be inferred from the statements of Eudocia and another late writer. We learn from Pliny that this building was surrounded by thirty-six columns, and surmounted by a pyramid tapering to a point like a meta by twenty-four steps; on the summit was a marble chariot. The whole height was 140 feet, or, according to the reading in some MSS., 100 feet; the length on the north and south sides 63 feet, the two fronts being something less. To adorn its sides with sculpture Artemisia employed four of the most celebrated artists of antiquity—Bryaxis, Timotheus, Leochares, Scopas or, according to Vitruvius, Praxiteles. Pliny tells us that Scopas worked on the eastern side, Bryaxis on the north, Timotheus on the south and Leochares on the west, and that it was principally the merit of their sculpture which made the Mausoleum one of the seven wonders of the world. Artemisia's short reign of two years did not enable her to see the whole of their great design carried into execution, but such was the emulation of the artists, that after her death they completed the work for their own honour and the glory of art. A fifth sculptor, Pythis, executed the marble quadriga by which the whole Mausoleum was surmounted. In the poem "De Spectaculis," attributed to Martial, we find a passing allusion to the marvellous structure of the Mausoleum in the expression, "the Mausolea which hang in the void air;" and Lucian, in a dialogue in which he introduces Mausolus speaking, gives us the more valuable information that the sculptures representing men and horses were of the most admirable art and of the finest marble. From the time of Strabo till the twelfth century we find ancient writers from time to time alluding to the Mausoleum as one of the seven wonders of the world, and as still existing; it is thus noticed in the second century by Pausanias, in the end of the fourth by Gregory of Nazianzus, by Constantine Porphyrogennetus in the tenth, by Eudocia in the eleventh, who must have been misinformed as to its site, for she describes it as built on a mound in a marshy lake; and again in the twelfth century by Eustathius, who speaks of it as still existing—"it was and is a wonder." At what time it fell into ruin cannot easily be ascertained, for it may still have been noted as one of the seven wonders of the world after it was in that state. In the year 1404 the knights of Rhodes took possession of Halicarnassus and built the present citadel, to which they gave the name of the Castle of San Pietro, or Pedro, whence perhaps the Turkish Budrum. Fontanus, the historian of the siege of Rhodes, of which he was the contemporary, states that a German knight named Henry Schlegelholt, began to construct it out of the materials of the Mausoleum. The structure, however, could have been only partially destroyed on this occasion, for in 1472, when Cepio visited Budrum in the expedition of Pietro Moncenigo, he noticed its remains amid the ruins of the town.

Illusions in Egyptian Building.

Egyptian buildings of large extent for the most part rise as we penetrate into them. When we pass from one limb to another we generally ascend a few steps. Sometimes, however, the ascent is more gradual. At the Ramesseum and again at Edfou the level of the ground rises from column to column, each column being placed on a low step a little above the preceding one. The effect is similar to that produced in a modern theatre by the slope of the floor to the back of the stage. It is aided by the general arrangement of doors and pylons, which diminish in size as we advance. An illusive perspective is thus obtained, the vistas of pillars seem twice the length that they really are, and the entire building appears to be of a length almost interminable.

"Spanish Gold."

In the book of recipes relating to the arts, known as 'Theophilus de Diversis Artibus," which probably dates from the twelfth century, is one for producing "Spanish Gold." It is as follows:—"There is also a gold called Spanish gold, which is composed from red copper, powder of basilisc, and human blood and acid. The Gentiles (*i.e.* the Arabs of Spain, who were probably skilful in this art) make basiliscs in this manner. They have underground a house walled with stones everywhere, above and below, with two very small windows, so narrow that scarcely any light can appear through them; in this house they place two old cocks of twelve or fifteen years, and they give them plenty of food. When these have become fat, through the heat of their good condition, they agree together and lay eggs; which being laid, the cocks are taken out and toads are placed in, which may hatch the eggs, and to which bread is given for food. The eggs being hatched, chickens issue out, like hens' chickens, to which after seven days grow the tails of serpents, and immediately, if there were not a stone pavement to the house, they would enter the earth. Guarding against which, their masters have round brass vessels of large size, perforated all over, the mouths of which are narrow, in which they place these chickens, and close the mouths with copper coverings and inter them underground, and they are nourished with fine earth entering through the holes for six months. After this they uncover them, and apply a copious fire until the animals inside are completely burnt; which done, when they have become cold, they are taken out and carefully ground, adding to them a third part of the blood of a red man, which blood has been dried and ground. These two compositions are tempered with sharp acid in a clean vessel; they then take very thin sheets of the purest red copper and anoint this composition over them on both sides and place them in the fire. And when they have become glowing they take them out and quench and wash them in the same confection; and they do this for a long time until this composition eats through the copper, and it takes the colour of gold. This gold is proper for all work." Mr. Ruskin considers the word "basiliscus" should have been translated "cockatrice" instead of "basilisk." According to Mr. Hendric the language of Theophilus is symbolical, but Mr. Ruskin says, "We have no doubt the monk wrote what he had heard in good faith, and with no equivocal meaning; and we are even ourselves much disposed to regret and resist the transformation of toads into nitrates of potash and of basilisks into sulphates of copper."

Æsthetic Evolution in Man.

Children and early races care little for nature; it is only among the most cultivated classes of the most advanced types that the æsthetic faculty reaches this its highest and most disinterested stage. All art is at first frankly anthropinistic. Early painting, such as that of the Egyptians and Assyrians, dealt only with human and animal figures; it represented men and women, kings and queens, gods and goddesses, hunters and lions, herdsmen and cattle; but it never attempted landscape or scenery. Mediæval art in its early stages only changed its characters to saints and angels, priests and bishops. But as it progressed from its Byzantine type it also gradually gave more and more importance to accessories in the background, in which hills, cities, rocks and trees began to play a conspicuous part. At last, after the Renaissance landscape-painting became a recognised and separate branch of pictorial art, first with an admixture of figures, wild animals or still life, but afterwards in a more fully differentiated form, with all its varieties of marine, architectural, forestine or river subjects, its waterfalls, its clouds, its rocks, its valleys and its heather-clad hills. Even in our own day very young people and the uncultivated classes care little for any but figure-painting; children pass over the landscapes in their picture-books, and fasten at once upon the man on horseback or the boy with a top. The first object they try to draw for themselves is a human face. So, too, with literature. All primeval literary works consist of a legend, a story historical or mythical, the tale of what some man or some god has done. To the very end novels, plays and biography, the most human in their interest, are the favourite forms of literature. Poetry at first is all epic or narrative; lyric and descriptive verse only come in at a much later point of evolution, and are seldom thoroughly relished by any but the most cultivated. "Tell me a story," says the youngest child. "History is the most delightful of studies," says the Roman philosopher. We may take the Homeric poems as an excellent illustration of human æsthetic feeling in this its naïvely anthropinistic stage. In them we find human beauty abundantly recognised and admired. Helen, for whose sake Trojans and Achaians may well contend through ten long years; Paris, on whose eyes and hair Aphrodite pours the gift of loveliness; the golden locks of Achilles, the white arms of Hera, the hazel eyes of Athene, the fair cheeks of Briseis. There is much admiration, too, for works of primitive art—the golden-studded sceptre, the polished silver-tipped bow of horn, the jewelled girdle of Aphrodite, the wrought figures on Achilles's shield, the embroidered pattern on the many-coloured peplum which Theanô offers on the knees of Athene. The palaces of Priam and of the Phæacians excite the warmest praise of the rhapsodist. But of scenery there is little said, as is also the case in the Hebrew poets. The garden of Alcinous is, after all, but a well-ordered fruit orchard. Nature is only alluded to as a difficulty to be overcome by man—the barren, harvestless sea; the high, impassable mountains; the forests where roam the savage wild beasts.

Individuality in Architecture.

There never was a fallacy more injurious to architecture than the sophism, "De gustibus non est disputandum." There may be, indeed, a wide range and liberty allowed in matters of taste, but there must be a limit somewhere. Where can that limit be better placed than as a barrier to overstepping all reasonable analogy and the "modesty of nature?" The great mass of the people may not, perhaps, judge of architecture by the abstract principles which we have here feebly attempted to express, but the impressions produced on their minds, though independent of logical deduction, will be adverse to all architecture in which antagonistic effects are combined, and individual members are applied to purposes for which they were never intended. There is in us all an universal admiration of fitness, consistency and order which arises from the contemplation of the works of nature, and this inherent faculty will, when the trammels of usage are overcome, be applied to the examination of works of art. The criticism will be applied by the great mass of the people instructively, unconsciously almost, and independently of all set rules; but, being based on the natural faculties of the mind, will lead to conclusions which, as far as they extend, will be as incontrovertible as those of the profoundest and most mature judgment.

The Decoration of St. Paul's.

In the early part of 1774 the members of the Royal Academy, conscious of the necessity of making some effort for extricating historical painting out of the confused mass of meaner arts with which it was indiscriminately jumbled, did, with the consent of the Dean and Chapter, select six painters to execute each a large picture of Scripture history, which he had the liberty of presenting to the Cathedral of St. Paul; but obstacles arose which prevented its taking effect. This project was frustrated, as is well known, by Dr. Terrick, then bishop of London. Dr. Newton, bishop of Bristol, and dean of St. Paul's, when he applied to Dr. Terrick for his consent—"the old bishop," says Northcote, "patiently heard him to the end of his speech, when, assuming a very grave countenance, he replied, "My good Lord Bishop of Bristol, I have already been distantly and imperfectly informed of such an affair having been in contemplation; but as the sole power at last remains with myself, I therefore inform your lordship that whilst I live and have the power I will never suffer the doors of the metropolitan church to be opened for the introduction of Popery into it."

The Ancient Adze.

A proverbial expression of the Romans was derived from the use of the adze or ascia. The phrase "Jam hoc opus est exasciatum" means "This work is now begun," because the rough-hewing of the timber by means of the ascia, the formation of balks or planks out of the natural trunk or branches of a tree, was the first step towards the construction of an edifice. Vitruvius and Palladius give directions for using the ascia in chopping lime and mixing it so as to make mortar or plaster. For this purpose we must suppose it to have had a blunt unpolished blade and a long handle. In fact it would then resemble the modern hoe as used either by masons and plasterers for the use just specified, or by gardeners and agriculturists for breaking the surface of the ground and eradicating weeds. Accordingly Palladius in his enumeration of the implements necessary for tilling the ground, mentions hoes with rakes fixed to them at the back. Another instrument, called the Acisculus, was chiefly used by masons, whence, in the ancient glossaries, Aciscularius is translated a stone-cutter. The acisculus, or pick, was a little curved and it terminated in a point in one direction, and was shaped like a hammer in the other. Its helve was inserted so that it might be used with the same kind of action as the adze. Also, as the substantive ascia gave origin to the verb exasciare, meaning to hew a smooth piece of wood out of a rough piece by means of the adze, so acisculus gave origin to exacisculare, meaning to hew anything out of stone by the use of the pick. Various monumental inscriptions, published by Muratori, warn persons against opening or destroying tombs by this process.

GENERAL.

Professor Montelius has been appointed Yates Lecturer in Archæology at University College, London, for 1900.

The Prince of Wales will to-day lay the foundation-stone of the new buildings of the Royal School of Art Needlework at South Kensington, which will cost 34,000*l.* Mr. F. B. Wade is the architect.

The Elizabethan Mansion House known as Brantinghamthorpe Hall, the Yorkshire residence of the late Mr. Christopher Sykes, is to be offered for sale at York early in the ensuing month.

Mr. G. Wise has been elected manager of the Works Department of the West Ham Town Council, as a large hospital and workmen's dwellings are to be carried out without the aid of a contractor.

The Society of Arts has affixed memorial tablets on the following houses:—Belmont, Roslyn Hill, Hampstead, formerly the residence of Sir Harry Vane; No. 50 Wimpole Street, where Mrs. Browning lived, and from which house she was married. Bolton House, Windmill Hill, for many years the residence of Joanna Baillie, the dramatist, will also be similarly distinguished.

A Meeting of representatives of the trade unions chiefly affected by the present dispute in the building trade has been held in Manchester. A week ago these representatives met and drew up a basis for a joint conference in the establishment of district boards of conciliation, with a central board to which appeal could be made if necessary. During the week the scheme has been submitted to and has received the sanction of the executive committees of the unions concerned.

The Top of a column of Phrygian marble, 4 feet thick, standing apparently *in situ*, has been discovered in the Forum of Rome on the site of the basilica Emilia, now being excavated by the Italian Government in consequence of the munificent gift of 2,400*l.* recently made by Mr. Lionel Phillips, through the instrumentality of Mr. St. Clair Baddeley. The column is believed to form part of the original structure of the basilica.

The Company of Makers of Playing Cards offer the H. D. Phillips prize of 10*l.* 10*s.* for the best special design for the backs of playing cards intended for presentation by the company to its guests at the inauguration banquet of the masters and wardens in November. Three other prizes of 5*l.* 5*s.*, 3*l.* 3*s.* and 2*l.* 2*s.* respectively are offered by the company for the three next best designs. The designs must be in colour, and such as can be reproduced effectively in not more than six printings. Each design must be on a separate card of the exact size of a playing card, viz., 3 9-16 inches by 2½ inches, and not mounted. The arms of the company and of the City of London are to form a portion of the design.

THE

Architect and Contract Reporter

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, Imperial Buildings, Ludgate Circus, London, E.C.

For Advertisement Scale, see page xiii.

COMPETITIONS OPEN.

HARROGATE.—July 3.—Premiums of 150*l.*, 100*l.* and 75*l.* are offered for designs for erection of a new Kursaal, &c., in connection with the Spa Concert Room. Cost not to exceed 30,000*l.* Mr. S. Stead, Municipal Offices, Harrogate.

PLUMSTEAD.—July 27.—Designs are invited for proposed new municipal buildings and public library, to cost about 40,000*l.* Premiums of 100*l.*, 75*l.* and 50*l.* Mr. Edwin Hughes, vestry clerk, Vestry Hall, Plumstead.

WAKEFIELD.—June 30.—The Wakefield Industrial Society, Limited, offers three prizes for the best architectural designs for new central buildings most suitable to meet their requirements. Prizes: (1) 50*l.*, (2) 30*l.*, (3) 20*l.* Full particulars at the Office, Bank Street, Wakefield.

CONTRACTS OPEN.

ACCRINGTON.—June 26.—For erection of the proposed new drill hall, Milnshaw. Mr. Henry Ross, 15 Cannon Street, Accrington.

ALNWICK.—June 26.—For repairs to various highway bridges. Mr. James Short, highway surveyor.

ASHINGTON.—June 24.—For erection of business premises, at New Hirst, Ashington. Mr. John Magin, secretary, Co-operative Society, Ashington.

ASHTON-UNDER-LYNE.—For erection of a detached villa residence. Mr. T. D. Lindley, architect, Market Avenue, Ashton-under-Lyne.

BAKEWELL.—For erection of retort-house at the Gasworks. Mr. Vernon R. Cockerton, clerk, Bakewell.

BARNSLEY.—June 27.—For erection of two dwelling-houses, &c., in Grafton Street. Messrs. Wade & Turner, architects, 10 Pitt Street, Barnsley.

BARROW-IN-FURNESS.—June 28.—For extensions to the sewage pumping-station at Salthouse. The Borough Engineer, Town Hall, Barrow-in-Furness.

BARROW-IN-FURNESS.—June 28.—For extensions to the existing electricity works in Buccleuch Street. The Borough Engineer, Town Hall, Barrow-in-Furness.

BARTON-ON-HUMBER.—For rendering of the walls of a gasholder tank, and for the puddling and concreting of the bottom of the same. Mr. W. H. Goy, secretary to the Gas Company, Barton-on-Humber.

BEDFORD.—June 30.—For conversion of the old vagrant wards into receiving wards, and for the construction of new closets, &c., at the workhouse. Mr. Henry Young, architect, 35 Maitland Street, Bedford.

BIRKENHEAD.—June 26.—For alterations at the meat store of the workhouse at Tranmere. Mr. John Carter, clerk, 45 Hamilton Square, Birkenhead.

BRIGHTON.—June 27.—For internal and external repairs, painting, &c., to Board schools during the month of August. Messrs. T. Simpson & Son, 16 Ship Street, Brighton.

BRIGHTON.—June 30.—For construction of an underground convenience, with works connected therewith, around the base of the clock tower, Queen's Road, Brighton. Mr. Francis J. C. May, Town Hall, Brighton.

BRIGHTON.—July 27.—For alterations and additions to the public library, museum and art gallery on the Pavilion estate. Mr. Francis J. C. May, Town Hall, Brighton.

BUTTERSHAW.—June 29.—For erection of eight houses. Messrs. Brayshaw & Dixon, architects, Bowling Old Lane, Bradford.

BUXTON.—For erection of schoolroom, Ladmanlow. Messrs. Garlick & Flint, architects, 5 Terrace Road, Buxton.

CARDIFF.—June 30.—For alterations to Stacey Road Board school. Mr. E. Bruton, architect, 15 Queen Street, Cardiff.

CARDIFF.—June 30.—For erection of a bank and office premises in Queen Street. Messrs. James & Morgan, Charles Street Chambers, Cardiff.

STURTEVANT
FAN SYSTEM
OF WARMING AND VENTILATING.
(PLENUM METHOD.)
STURTEVANT ENGINEERING CO. 75 QUEEN VICTORIA ST. LONDON.
GLASGOW, BERLIN, STOCKHOLM, MILAN, AMSTERDAM.

CARLISLE.—June 26.—For erection of seven houses in Wigton Road. Mr. James Leslie, architect, 71 Broad Street, Carlisle.

CARLISLE.—June 26.—For alterations to w.c. accommodation to ward annexe and doctor's house. Mr. Geo. Dale Oliver, county architect, 5 Lowther Street, Carlisle.

CHATHAM.—June 30.—For erection of a post office at Chatham. Messrs. Widnell & Trollope, architects, Broad Sanctuary Chambers, Westminster, S.W.

CORNWALL.—June 28.—For restoration of the tower of St. Odulph's Church, Pillaton. Mr. Henry Geo Luff, architect, 64 Chapel Street, Devonport.

CREWE.—June 29.—For erection of a chimney-stack and buildings, including iron roofwork and water-tank, for the electricity works, Edleston Road. Messrs. Hopkinson & Talbot, architects, 29 Princess Street, Manchester.

DERBY.—July 6.—For erection of the new depôt, Nottingham Road. Mr. John Ward, borough engineer, Babington Lane, Derby.

EDINBURGH.—June 26.—For extension of boiler-house, central station. Mr. Thomas Hunter, W.S., town clerk, City Chambers, Edinburgh.

ELLERTON.—For rebuilding a cottage. Mr. Joseph Tate, Ellerton.

FAREHAM.—July 12.—For alterations and additions at police station and petty sessional court. Mr. W. J. Taylor, county surveyor, The Castle, Winchester.

FARNBOROUGH.—July 4.—For erection of a cottage at the sewage farm. Mr. R. Walter Knapp, surveyor, Town Hall, Farnborough.

GLOUCESTER.—June 26.—For erection of two cottages on the Box farm, Awre. Mr. Thomas Cadle, surveyor, Lynwood, Denmark Road, Gloucester.

GREAT HORTON.—June 27.—For erection of a shop and house in High Street. Mr. Sam Spencer, architect, 344 Great Horton Road, Great Horton, Bradford.

HALIFAX.—June 27.—For erection of 11 houses at Ovenden Wood, adjoining Wheatley station. Messrs. Jackson & Fox, architects, 7 Rawson Street, Halifax.

HALIFAX.—June 28.—For erection of a detached villa residence on the Greenroyd estate. Mr. Medley Hall, architect, 29 Northgate, Halifax.

HEREFORD.—For erection of extensive business premises. Mr. W. W. Robinson, architect, 10 King Street, Hereford.

ILKLEY.—June 26.—For alterations and additions to Burnside Villa. Mr. Herbert Hodgson, architect, Old Bank Chambers, Bradford.

IRELAND.—For restoration of the manor house, Moneymore. Mr. Henry Byrne, Moneymore.

IRELAND.—For erecting presbytery and offices at Ballygran, co. Limerick. Mr. J. Carroll, architect, Killacolla, Ballygran, Charleville.

IRELAND.—June 27.—For resheeting with ½-inch boards the nurses' room in the fever hospital, Ardee. Mr. T. B. Dromgoole, clerk.

IRELAND.—June 27.—For erection of stationmasters' houses at their Bundoran and Belleek stations, for the Great Northern Railway (Ireland) Company. Mr. T. Morrison, secretary, Amiens Street Terminus, Dublin.

IRELAND.—June 28.—For partial reconstruction of the bridge over River Blackstaff at Great Victoria Street. Sir Samuel Black, town clerk.

IRELAND.—June 29.—For erection of a dispensary residence in the townland of Gurraneboy, Cork. Mr. D. J. Coakley, Board Room, Workhouse.

IRELAND.—June 29.—For repairing and painting Liberty Street dispensary and the repairing of Carrignavar dispensary, Cork. Mr. D. J. Coakley, Board Room, Workhouse.

IRELAND.—June 30.—For erection of two labourers' cottages at Leixlip, Celbridge. Mr. L. A. McDonnell, 33 Kildare Street, Dublin.

IRELAND.—July 6.—For erection of a lighthouse, keeper's dwelling, stores, fog-signal house, outbuildings, walls, roads, &c, on Blackhead, co. Antrim. Drawings and specifications may be seen at the Irish Lights Office, Dublin, or at the coastguard station at Whitehead, co. Antrim.

IRELAND.—July 10.—For erection of a new post-office at the Curragh Camp. Mr. H. Williams, secretary, Office of Public Works, Dublin.

KEIGHLEY.—For additions to Vulcan Works, Strawberry Street. Messrs. John Judson & Moore, architects, York Chambers, Keighley.

KEIGHLEY.—June 27.—For erection of municipal offices in Bow Street. Mr. W. H. Hopkinson, borough engineer, Low Bridge, Keighley.

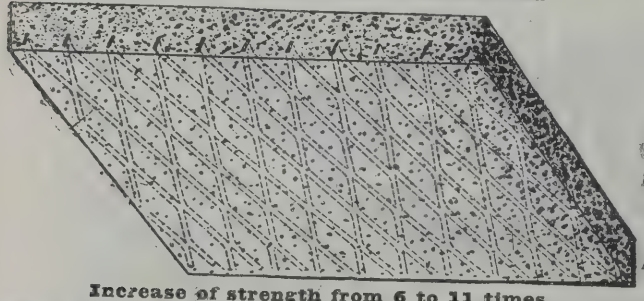
THE PROBLEM SOLVED.

ORDINARY WOOD RENDERED FIRE-RESISTING THROUCHOUT WITHOUT AFFECTING ITS UTILITY AS A BUILDING MATERIAL.

THE LONDON NON-FLAMMABLE WOOD COMPANY, LTD., who have recently introduced into Europe the process now being so largely used in America, have erected large works in this country, and are now taking orders for the supply of their NON-FLAMMABLE WOOD. The whole of the Carpentry and Joinery in the following notable buildings in New York, amongst others, consists of NON-FLAMMABLE WOOD:—The COMMERCIAL CABLE BUILDING, The QUEEN'S INSURANCE BUILDING, and the R. G. DUNN BUILDING



NON-FLAMMABLE WOOD has been tested by H.M. Admiralty, and large orders have been given by H.M. Government.

QUOTATIONS ON RECEIPT OF REQUIREMENTS.

ELECTRIC NOTES.

THE Cromer Urban District Council have decided to adopt electricity for the lighting of the district, and the engineer has expressed himself as being so confident of the undertaking proving a success that he has offered to forego half his fees until the works become a paying concern.

DURING the whole of Sunday night the electric-lighting supply to the city north of College Green, Dublin, was completely cut off owing to some mishap in the central depôt. The supply on the south side of the city was also cut off, with the exception of the lamps on the right-hand side of Grafton Street.

THE annual conversazione in connection with the Institution of Electrical Engineers was held on the evening of the 15th inst., in the Natural History Museum at South Kensington, and was attended by about 1,500 members and guests. Dr. Silvanus Thompson, F.R.S. (the president of the institution) and Mrs. Thompson received and welcomed the visitors. A programme of music, well rendered by the string band of the Royal Engineers, conducted by Lieutenant Sommer, added to the enjoyment of the company.

THE monthly meeting of the Hyde Town Council was held on the 12th inst., the mayor (Mr. Alderman Smith) presiding. At a meeting of the electric-light committee a report of visits to electric works at Blackburn, Burnley, Nelson, Manchester and Bury was submitted, and was carried unanimously, the recommendation of the sub-committee being that, subject to

TO ARCHITECTS, SURVEYORS, &c.

The Original Patentees and Sole Manufacturers of the MICA VALVE CHIMNEY BREAST VENTILATOR (patented by Comyn Ching & Co. under the name of "Thomas Boyle's Patent") having suffered for some time past by WORTHLESS IMITATIONS being supplied to Builders and others, which are badly fitted with inferior materials, neither Smoke-proof nor Proof against back-draught, are very noisy in action and soon get out of order,

Beg to call the attention of the Profession to the following fact:—

The only Perfect Ventilators have the Patentees' MONOGRAM CAST IN the front, and the only GUARANTEED NOISELESS is Ching's NEW PATENT SILENT Chimney Breast Ventilator with the NAME and MONOGRAM CAST IN.

TRADE  MARK.

Any Infringement of the above Patent or Trade Mark Monogram will be subject to an action at law.

ARCHITECTS SHOULD SPECIFY

CHING'S Patent Mica Valve Chimney Breast Ventilator, or
CHING'S New Patent Silent Chimney Breast Ventilator.

TO BE HAD OF ALL IRONMONGERS AND VENTILATING ENGINEERS IN THE UNITED KINGDOM.

SHIPLAKE COURT, HENLEY-ON-THAMES.

FRITWELL MANOR, OXFORDSHIRE.

the financial arrangements being satisfactorily concluded for borrowing the money, the time was now ripe for the Corporation to take such steps as would provide an electric-light works as soon as possible.

A SATISFACTORY condition of affairs is disclosed as the result of the first year's electric-lighting work at Torquay. The capital cost of the works amounted to 24,959*l.*, as compared with an estimate of 22,300*l.* Private lighting at Torquay increased from 3,310 eight candle-power lamps in March of last year to 5,644 last month, and the consumers from 55 to 140, and there were applications in hand from 15 consumers for 529 more lamps. Of the total number of units generated during the twelve months ending March 31, 80,490 were used for public lighting, 67,909 for private lighting and 12,282 expended on excitation. The revenue amounted to 2,839*l.* and the costs of working to 1,781*l.*, leaving a gross profit of 1,057*l.* After meeting the principal and interest of 1,188*l.* it left a deficit on the first year's working of only 130*l.*, and next year's working should show a clear profit.

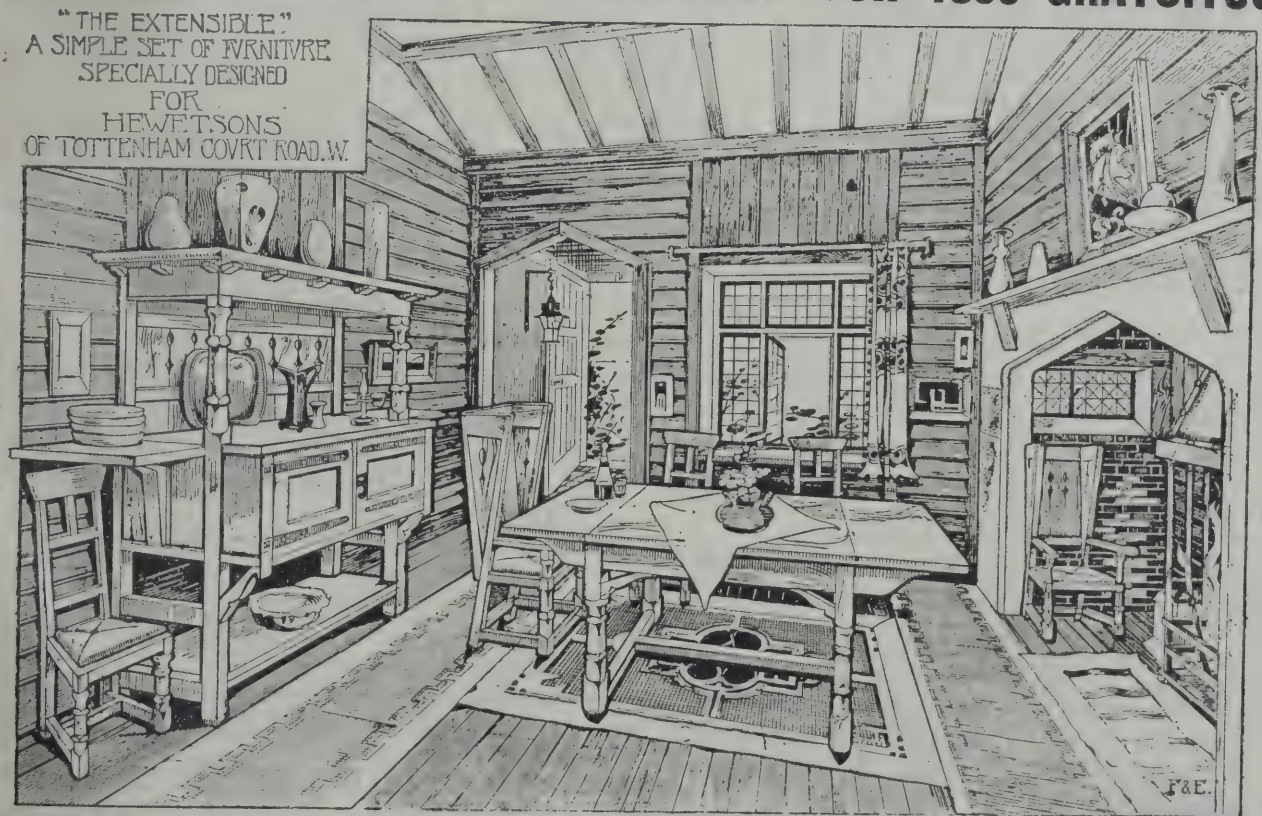
A MEETING of the electric-lighting committee of the Middlesbrough Corporation was held on Tuesday afternoon, under the presidency of Alderman Jones. The Town Clerk (Mr. George Bainbridge) stated that he had received a letter from the Local Government Board which stated that they were prepared to sanction the borrowing of 36,000*l.* for electric-lighting purposes. A letter was read from the North-Eastern Railway Company asking when the Middlesbrough electric plant would be ready for the supply of electrical power, as they wished to know whether the Corporation would be prepared to supply them power to drive twenty electric cranes they proposed erecting at the new Middlesbrough Docks. If the Corporation would be prepared to supply power at a reasonable cost, they would be prepared to avail themselves of their power in preference to enlarging their own plant. The Town Clerk said that it would not be ready for at least twelve months. It was eventually decided to arrange a meeting between Mr. Hammond, who had charge of the undertaking, and the engineer to the North-Eastern Railway.

VARIETIES.

MR. DAVID MAXWELL, C.E., late water engineer to the Hull Corporation, died at Hull on Saturday evening in his eightieth year.

MR. GEORGE SPALDING FLEETWOOD, of New Court, Carey Street, Lincoln's Inn, W.C., has been appointed surveyor to the Corporation of the Orphan Working School in place of Mr. George Fleetwood, deceased.

A LARGE portion of the Cockett tunnel on the Great Western Railway, near Swansea, fell in about eight o'clock on Monday evening, entirely stopping the traffic. A large number of people of West Swansea who had been to Barnum's Show were unable to return home. The accident occurred just before a passenger train was due.



THE new hospital recently erected by the Govan Parish Council at Merryflatts, Govan, was formally declared open on the 15th inst. in the presence of a large company. The main block consists of four double breadth wards, each 95 feet by 24 feet, and holding twenty-eight beds, with a frontage of 145 feet, and two storeys in height. The approximate cost of the buildings is 20,000*l.*

THE new Malone Presbyterian church at Balmoral was opened on Sunday. It occupies practically the position of the old edifice, which has been entirely removed. The church, which has a frontage both to the Lisburn Road and Balmoral Avenue, consists of a nave and aisles with large projecting transepts, and includes a spacious gallery approached by two staircases from the vestibule, the whole being arranged to accommodate upwards of 1,000 persons. The building, which is a handsome one in every respect, will cost a sum of 6,000*l.*

MESSRS. KIRK & RANDALL, the well-known contractors of Woolwich, have just completed the erection of a large goods warehouse at Broad Street, City, for the London and North-Western Railway Company, from the designs of Mr. Francis Stevenson, chief engineer, Euston Station, assisted by Mr. E. B. Thornhill, with Mr. Keyte as resident engineer. The building covers an area of 50,000 square feet, and consists of four floors and two basements, and its cost was rather more than 100,000*l.* It is lighted throughout by electricity, and it is said to be the best and most fireproof warehouse in London.

A GENTLEMAN, who prefers to remain anonymous, has promised 3,500*l.* for the purpose of erecting a municipal museum and art gallery adjoining the Central Free Public Library at Hampstead. The library was erected in 1897 by

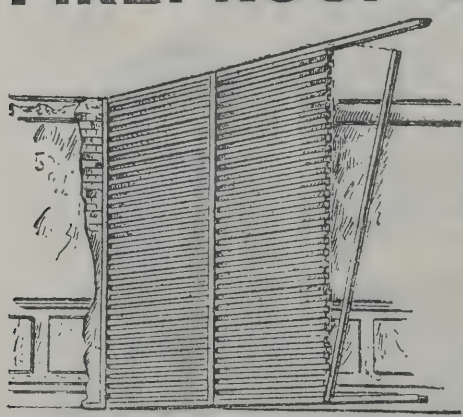
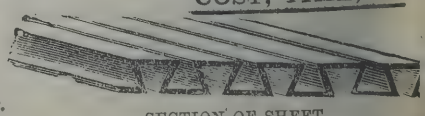
HOTELS, CLUBS, AND PUBLIC INSTITUTIONS COMPLETELY FURNISHED.
HEWETSONS, TOTTENHAM COURT ROAD, LONDON, W.

Sir Henry Harben, J.P., the chairman of the Hampstead Vestry, at a cost of over 5,000*l.* The question of the museum and art gallery is now under the consideration of the Libraries Committee of the Hampstead Vestry, who will be responsible for its up-keep and management when it is completed.





As a practical outcome of the Cromwell Tercentenary meetings held at Naseby on April 27, a scheme has been started for a Memorial Library of the great Civil War. Though primarily intended to commemorate Oliver Cromwell, it has been wisely decided to make the library representative of all aspects of the strife, from whatever standpoint it may be viewed. The village already possesses a reading-room and small library, but it contains hardly anything relative to the causes that have made Naseby so famous. Already many books and subscriptions have been received, and further gifts may be forwarded to the Rev. Thomas Ruston, Congregational minister, Long Buckby, Rugby.

A NEW church was consecrated on Friday last by the Archbishop of York in the little village of Colton, in the parish of Bolton Percy, Yorks. The church, which is dedicated to St. Paul, is built entirely of red brick, and is of the fifteenth-century Perpendicular style, but it has not a particularly ecclesiastical appearance. It is in the form of a parallelogram, and the nave and sanctuary are of the same width. The chancel is not furnished for a choir. The roof, internally, is panelled, and externally is covered with red tiles, the bell-cote being over the chancel step. The building has seating accommodation for eighty persons, and the seats, &c., are in green stained deal, and are unappropriated. The windows are of ordinary cathedral leaded glass, and the whole building is capable of future decoration, economy having had to be practised. The architect was Mr. Hodgson-Fowler, F.S.A., of Durham, and the contractor Mr. A. Barnes, of Malton.

THE new Wesleyan chapel in Stoney Stanton Road, Coventry, is now practically completed, and will shortly be opened for divine service. It is a handsome building and adjoins the old school chapel, which will in future be utilised for the purposes of a Sunday school. It is in the Gothic style of architecture and is of brick, with red Hollington stone dressings. The entrance is under a square tower, above which there rises, to a height of 90 feet, a graceful stone spire. The church is designed in the form of a cross, with nave, north and south aisles, transepts and chancel, the dimensions being about 70 feet by 50 feet. The nave is connected with the side aisles by four arches on each side supported on red Hollington stone pillars, with moulded capitals and bases. The transepts are lighted by four-light windows divided by mullions, and the aisles by three-light windows. The upper portion of the nave has clerestory lights and rose window at the gallery end in the east gables. Vestries for minister, stewards and choir have been provided, with suitable lavatory accommodation. The heating is to be carried out with hot-air and water, the apparatus chamber being placed under the choir vestry. The whole of the internal woodwork is of pitch pine varnished. The chapel has been designed by and erected under the superintendence of Messrs. Harrison & Hattrell, architects, Mr. C. Garlick being the contractor. The chapel will accommodate 700 persons, and the cost has been 3,000*l.*

THE Dominican Priory church at Hawkesyard, near Rugeley, the foundation-stone of which was laid just three years ago, was consecrated on the 12th inst. The style of the new building is late Perpendicular Gothic, red bricks being used, with dressings of Penkridge stone. The internal dimensions are—Length, 120 feet; width, 30 feet; height, 54 feet. The main entrance is deeply recessed and moulded, and above it is a fine traceried seven-light window. In the gable above is a niche in which stands, underneath a rich canopy, a large-sized statue of St. Thomas Aquinas, to whom the church is dedicated. There are nine bays in the interior, marked out by stone shafts coming about half-way down the walls. The fifteen clerestory windows occupy nearly every bay on either side of the church. The roof is of open timber. The sanctuary floor is of mosaics of an elaborate design. The high altar and reredos form a striking feature. The altar stands forward, allowing of a flight of steps at the back up to the throne. The low super-altar, in front of which stands the rich metal tabernacle by Hardman, has its six panels filled with mosaics. When completed the reredos will rise up to the roof timber; at present only some two-thirds of it are finished. The lower portion, to the top of the super-altar, is of plain masonry, relieved by a gabled piscina and aumbry. Above these, in the centre, are the throne and canopy, rich with delicate tracery and carving. Right and left of these rise two tiers of niches, with delicately-worked shafts. The organ case, designed by Wren and originally erected at Eton, is a beautiful example of the Renaissance style. On the right of the west entrance is a richly-moulded arch, opening into the chantry chapel, erected to the memory of the late Mr. Spode, to whose beneficence the erection of the church is

largely due. The lady chapel is on the opposite side, and occupies the space of two bays. The roof is panelled in wood, and the altar and reredos are of stone.

TRADE NOTES.

THE Woburn Sands Board Schools are being warmed and ventilated by means of Shorland's patent Manchester grates and patent exhaust roof ventilators supplied by Messrs. E. Shorland & Brother, of Manchester.

THE new premises for the National Telephone Company, Limited, Belfast, have been fitted with an entirely new installation for their complete warming and ventilation by John King, Limited, engineers, Liverpool, by means of their Rajah ventilating radiators and their patent tubular exhaust ventilators.

MESSRS. HUMPIDGE, HOLBOROW & CO, Limited, makers of the "Dudbridge" gas and oil engines, notify us that they have given up their offices in Cannon Street and taken larger premises for offices, showrooms and workshops at 95 Southwark Bridge Road, S.E.

THE directors of the London Portland Cement Company, Limited, who are interested in a new fireproof building material called "Scagliol," to the satisfactory demonstration of the fire-resisting qualities of which we had occasion to refer in our issue of August 5, 1898, have arranged for another exhibition to take place at Wood Lane, Shepherd's Bush (on land belonging to the Central London Railway), at 3 o'clock on Thursday next, the 29th inst., when a building constructed of "Scagliol" will be tested by fire, and the different uses to which the material may be applied and the methods of construction and manufacture will be demonstrated

NEW HOSPITAL, KIRKALDY.

THE new infectious diseases hospital which has been erected by the Corporation of Kirkcaldy, near Smeaton Row, was formally opened on the 17th inst. The hospital, which has been two years in construction, consists of the administrative block, two ward blocks and laundry and discharge buildings. The administrative block consists of the doctor's-room, dispensary, nurses' dining-room, kitchen, scullery, &c. and ten bedrooms. The eastmost ward block, intended for scarlet-fever patients, consists of two wards, a service-room between, bath-room and other accommodation. In this building fifteen beds will be placed. The westward block is divided into three groups of wards, where three classes of diseases can be treated. Each group consists of the two wards and service-room between, a bath-room and other necessary accommodation. This block is also arranged for fifteen beds, namely, seven enteric, six measles and two observation. The walls of the building are chiefly of brick. One novel feature in connection with the hospital is the sun-rooms, which are situated off the wards, and which convalescent patients can retire to during the day. A plentiful supply of hot water is provided for each group of wards by hot-water tanks. The laundry block consists of washing-house, ironing-rooms and rooms connected with the disinfector, engine-room, mortuary and ambulance sheds. The disinfector is one of Peck's patents. In addition to the caretaker's-rooms in the lodge, there is a waiting-room for visitors to the hospital. The drainage for the whole building is carried along to the south-west corner, where a septic-tank and filter are provided. The arrangements of the hospital are such that thirty patients can be treated, allowing a little over 2,000 cubic feet per patient, and in the event of an epidemic breaking out in the burgh double this number can be comfortably cared for. The cost of the whole building and furnishing will be about 11,000*l.* The architects are Messrs. Campbell, Douglas & Morrison, Glasgow.

EXPENDITURE ON BARRACKS.

A RETURN giving the approximate estimate of expenditure for the year 1899-1900 under the Barracks Act of 1890 and the Military Works Act of 1897 has been laid upon the table of the House of Commons. Under the Barracks Act the following items of expenditure are set out:—(1) Construction and reconstruction of camps, including married soldiers' quarters, 53,000*l.*; (2) provision of new and enlargement of present barracks and quarters for married soldiers, 102,000*l.*; (3) purchase of land and buildings, 12,000*l.*; (4) contingent expenses, 5,000*l.*; total, 172,000*l.* Under the Military Works Act the expenditure is thus detailed:—(1) Defence works, 300,000*l.*; (2) barracks, including completion of large camps, 510,000*l.*; (3) ranges, including accommodation for manœuvring and mobilisation, 400,000*l.*; staff and contingencies, 40,000*l.*; total, 1,250,000*l.* From these figures it will be seen that the total estimated expenditure under both Acts amounts to 1,422,000*l.*

PATENT CRYSTALLINE TILES
The Opal Glass Tiles are manufactured both in White and Colour. They are coated on the back with white enamel, which adheres strongly to Portland or other cement, and are also provided with keys of firmly fixed Marble. They are not affected by water, Cement of dark colour cannot show through on the face, and they form exceedingly bright and pretty coverings for lavatories, hospitals, &c. They do not craze, and are not easily broken when fixed, and are cheaper and better than any other similar tile.

BUILDING AND BUILDERS.

A NEW Baptist church is in course of erection at Loughborough.

ON Saturday afternoon the memorial-stone was laid of the new Free church at Elderslie. The estimated cost is 1,850*l.*

THE plans of a new schoolroom in connection with the Bethania C.M. chapel at Pentre have been approved by the Flintshire Monthly Meeting, and it is expected that building operations will soon commence.

THE foundation-stone was laid on Tuesday of a new Congregational chapel, which is to be erected at Thames Ditton, Surrey, to take the place of the existing building, which has become totally inadequate for the needs of the congregation.

THE memorial-stones of a new Wesleyan chapel, to cost about 2,750*l.*, were laid on Saturday at Dearnley, near Littleborough. The old chapel, after undergoing slight alterations, is to be used as a Sunday school.

A LOCAL GOVERNMENT BOARD inquiry was held at the Dukinfield District Council Offices on the 15th inst. in regard to the application of the District Council to borrow about 12,000*l.*, principally for the erection of a new town hall, a small portion being for sewerage.

EXTENSIVE alterations are being made at the premises of the Smethwick Conservative Club, in High Street, Smethwick, estimated to cost between 700*l.* and 800*l.* The billiard-room is being converted into a secretary's office and committee-room, and a new billiard-room is being erected at the rear of the premises. Some alterations are also being carried out at the front of the building.

AT a conference of representatives from St. Andrews and Cupar district committees at Cupar it has been unanimously agreed to erect an hospital at Balmullo, north of Leuchars, and it was remitted to the St. Andrews committee to take the necessary steps regarding the site and the expense of the erection.

COUNCILLOR FOX, a member of the Greetland (Halifax) District Council, has given notice that at the next meeting he will move that the Council request its architect to prepare plans and specifications for the erection of Council offices, stables, hose tower, fire-engine and ambulance-carriage house, and, if possible, to erect a few cottages on land acquired by the Council.

AT a recent meeting of the Cromer Urban District Council it was decided to purchase Fountain House, Garden Street, Cromer, at a sum of 1,200*l.* for the purpose of conversion into Council offices, fire brigade station and storeyard, and that plans and specifications be prepared for the purpose of laying before the Local Government Board an application to sanction the purchase.

THE Wesleyan chapel committee have sanctioned the erection of forty new chapels, involving an estimated expenditure of 76,500*l.* In addition, 10,750*l.* are to be expended on chapel and school enlargements. These, with other cases sanctioned during the past few months, bring up the aggregate expenditure to nearly 500,000*l.*, making altogether an outlay of one million sterling for the past two years in Great Britain alone.

AT a meeting of the Grimsby Public Free Library committee plans and estimates were accepted for converting the Mechanics' Institute into a public free library, at a cost of 1,400*l.* for the alterations, exclusive of the cost of books. There are between three and four thousand volumes at present in the library, and it was decided that these be purchased, and about 450*l.* be allowed for the purchase of books each year. The building could be at the Corporation's disposal by July 1.

THE new Roman Catholic Cathedral which is to be erected at East End, Greenock, is expected to be a handsome building, and will be purely Gothic in design, of red sandstone from Dumfries Quarries, while the stonework inside will be from the Pruden Quarries, England. The front elevation will be to Carnock Street, with side elevation to Dellingburn Street. When finished it is expected to have cost about 12,000*l.* Messrs. Pugin, London, are the architects.

THE foundation-stone was laid on the 15th inst. of the new premises of the Zion Baptist Sunday-schools and classrooms at Pitt Street, West Barnsley, on a site having frontages to Race Common Road and Pitt Street, bought at a cost of 550*l.* The schools and classrooms—a large room to seat 440, eight classrooms, a lecture hall and separate infants' classroom—are now being built at a cost of 1,800*l.* for the buildings, about 400*l.* in addition being required for furnishing. Mr. W. Senior is the architect.

THE foundation or memorial-stones of new schools were laid in Wellington Street East, Higher Broughton, Manchester, on Saturday last. The new buildings, which will cost about 6,000*l.*, together with a church to be erected alongside them, will take the place of the Salem church and schools, Strange

ways, which have been sold by the Methodist New Connexion to the Jewish community. In the schools will be accommodation for some 700 scholars, while the church will accommodate nearly the same number of adults. The new buildings are being erected by Mr. B. Powell from designs by Mr. A. W. Smith, architect, Manchester.

THE deputy city coroner of Liverpool held an inquiry on Tuesday into the circumstances attending the death of John Cornelius Vaughan, fifteen years of age, an apprentice bricksetter in the employ of Messrs. Morrison & Sons, contractors, of Wavertree, and who lived in No. 2 Court, Back Lime Street. On Saturday he was working on a scaffold at the Stanley Dock, and whilst so engaged he slipped and fell to the ground, a distance of about 28 feet, sustaining such injury as necessitated his removal to the Northern Hospital, where it was found that he was suffering from fracture of the skull. He continued unconscious, and died on the following day. The jury returned a verdict of "Accidental death."

A TERRIBLE accident happened on Monday afternoon at Berkeley Street, Piccadilly. The house at Nos. 1 and 2 Grafton Street, formerly the residence of Lord Spencer, is in course of demolition, and about half-past five an immense mass of timber and stonework fell from the upper storey into the basement, two men being buried. At ten minutes past seven a loud cheer announced the fact that one of the men had been got out. He was terribly injured, and had sustained one fearful wound in the skull. He was removed to St. George's Hospital. His name is Morris, and he lives at Westgate Terrace, Kensal Road, N.W. The body of the other man, whose name was Marks, was not recovered till Tuesday morning. It was clear from the appearance of the body that death must have been instantaneous. The injured workman Morris is stated to be progressing favourably.

A NEW Congregational church is about to be erected in Harehills Road, Leeds, from designs prepared by Mr. Tom Dyer, Albion Street. The existing structure was built in 1891, but it has only accommodation for 350 worshippers, and already fails to meet the requirements. The new church is planned to seat 750 persons. It will have nave and transepts, and a gallery at the end over the main entrance. Vestries for the pastor and choir, and ladies' and gentlemen's cloak-rooms will be provided. The entrances, which are spacious, are provided with inner lobbies. Internally, the walls will be plastered and decorated, the roofs open-timbered and the woodwork throughout of pitch pine, stained and varnished. The building will be of brick with stone dressings, and the tower will rise to a height of about 100 feet. The windows will be filled with tinted glass.

AT the ordinary monthly meeting of the Morecambe School Board it was resolved to ask the consent of the Department to the purchase of an additional 1,314 yards of land at Bare, with a view to the enlargement of the existing infants' school and the addition of a junior mixed department. The land is being purchased from Mr. J. Lodge, of Bare Hall, at 6*s.* per square yard. The Board's architects, Messrs. Marshall Bros., submitted three schemes, one providing for 180 additional children, at a cost of 1,440*l.*, one for 160, costing 1,120*l.*, and a somewhat more elaborate one providing for 155 children, at a cost of 1,240*l.* The scheme was afterwards considered in committee.

THE Morecambe District Council, sitting in special meeting on the 15th inst., was occupied for a long time in discussing ways and means towards a better provision for the science, art and technical classes in the town. Some time ago a valuable piece of land at the corner of Queen Street, Main Street and Green Street was acquired by the Council, with a view to part of it being utilised for a public street improvement at this point, and the rest being resold. On the recommendation of the technical instruction committee, the Council resolved to appropriate the remaining portion of the land as a site for new technical schools, subject to the sanction of the Local Government Board. The scheme submitted to the Council provides for the erection of a building which can be completed in two portions, the first costing 3,500*l.* and the whole 5,000*l.*

SOME important alterations are in progress at Drury Lane Theatre, in the rear of which a large plot of land has been acquired, and on it a number of offices and workrooms are now being erected, the new buildings covering an area of 135 feet by 95 feet. There will be an immense paint-room, 70 feet long by 35 feet broad and 140 feet high, fitted with every appliance for scene colouring, and just off it will be a carpenters' shop 40 feet square. Formerly the pantomime performers have had to practise their dances in the theatre, or wherever room could be found; now they will have a large ballet-room devoted to their convenience. Wardrobe stores, limelight tanks and similar necessary chambers take up most of the remaining space, but room has been found for three shops facing Drury Lane and several floors of flats overhead.

THE general committee of the Coventry and Warwickshire Hospital have approved of a scheme for the erection of isola-

tion wards adjoining the existing building. The need for such provision has been impressed upon the committee for some time past, and attention has been periodically called to it by the medical staff, resident and honorary. The extensions, tenders for the immediate carrying-out of which are invited, are to be erected at the rear of the existing hospital, and will be in keeping architecturally with the main building. The accommodation will consist of two wards, one double and the other single-bedded, the larger of which will be 15 feet by 13 feet, and the smaller 13 feet by 12 feet. These, with two bedrooms for nurses and with lavatory provision will be all upon the first floor. On the ground a new coal-house with two store-rooms will be arranged, the present accommodation of this character being entirely inadequate. The new block will be connected directly with the main central corridor on the first floor of the hospital, but the passage is to be shut off with folding-doors and cross-ventilated, so that the block will combine the advantages of being easy of access, and practically isolated.

THE memorial-stone of the twelfth public elementary school erected by the Salford School Board was laid on Tuesday last. The school is situate in North Grecian Street, Broughton, a rapidly growing neighbourhood, and in a sense is supplementary to the existing Grecian Street school, which was opened in the beginning of 1888 with accommodation for 970 children, but which has been filled for several years. The new buildings are of red brick faced with Accrington stock bricks and stone sills and dressings, and will furnish accommodation for 1,090 scholars. On the ground floor 590 infants will be provided for, and classrooms, &c., for 500 girls are arranged on the first floor. Both departments of the new school are being erected on the central hall system. A large assembly hall is provided on each floor, into which eight classrooms in the girls' and three in the infants' department open, each classroom accommodating from 50 to 60 children. Special provision is being made for instruction in cookery and laundry work. It is proposed, if possible, to light the school with electricity. An ample playground is included in the plans. These have been prepared by Mr. H. E. Stelfox, architect, King Street, Manchester, and the works are being carried out by Messrs. R. Neill & Sons. It is estimated that the building, furnishing, caretaker's house, &c., will cost 14,000*l*. The site forms a portion of the Clowes estate, and has been purchased subject to a chief rent.

A NEW free library has been erected in Faith Street, Maidstone, as a permanent memorial of the Queen's Diamond Jubilee. The building is in the Elizabethan style of architecture, and corresponding with the museum. The library itself is a lofty apartment 54 feet in length and 21 feet wide, with a moulded and panelled plaster ceiling. At present the interior arrangements are scarcely completed, but it is proposed to divide the room by screens and fittings for the purpose of the lending library and reading-room. An upper and similar apartment styled the county room is intended for the exhibition of special collections particularly interesting to the people of Kent. The floor space of this room will be entirely unobstructed, and a narrow and light iron gallery suspended from the open pitch pine roof renders the whole of the ample wall space available for the fixing of cases containing exhibits. The new rooms communicate by folding doors with the lower and upper halls of the School of Science and Art on the one hand, and with the Ethnographical and Fine Art rooms of the museum on the other. A small work-room has been provided on the upper floor, with communications between the Kent Archæological Society and county rooms. There is also a basement for the storage of newspapers, &c. The curator's residence occupies the site opposite the Free Library and with the latter the Technical School forms a new forecourt, 30 feet wide and receding 38 feet from Faith Street. Over the attractive entrance to the Free Library there is a capital head of Her Majesty worked in white stone, with the inscription "Victoria Library," and above there are the royal initials "V.R.," the borough arms, and the white horse of Kent. The total cost of the library and the curator's house amounts to about 3,600*l*. Mr. A. W. Smith is the architect and Mr. W. J. Logan the builder.

IN addition to a public park of 34 acres, the land for which was purchased by public subscription, in commemoration of the Diamond Jubilee, and which is now being laid out by the Tipton District Council at a cost of 5,000*l*., the development of the adjacent property has been commenced by Mr. W. H. Anderson, who has purchased an estate of 24 acres, mostly lying between the new park and the railway, and extending from Park Lane to near Watery Lane level crossing. The estate is very convenient, being near to both Tipton and Dudley Port stations, on the London and North-Western Railway, while Tipton and Dudley stations on the Great Western system are within easy distance. It is proposed to remove all the old structures on the land and erect thereon 800 houses of

various types, the rentals of which will range from 3*s.* 6*d.* per week to over 40*l.* per annum, the residences to include four of the bungalow type. A number of applications for tenancies have already been received, and it is expected that the whole of the estate will be developed and inhabited within two years. Some of the work is well in hand, and two rows of workmen's houses are in course of construction. What used to be a wide marl-hole adjoining the Dudley branch of the London and North-Western Railway will shortly be converted into building and garden land, and eleven new streets will be cut. According to present proposals the Seven Stars inn is to be demolished and a public hall erected on the site, for which a theatrical license will be applied for, the license of the public-house to be transferred to an extensive new hotel at the junction of Park Lane and Victoria Road. For the purpose of straightening and improving existing streets surrounding the estate Mr. Anderson has given over an acre of land to the District Council. The development of the estate is being carried out under the direction of Messrs. Perry & Nightingale, architects, of Dudley.

DISCOUNTS IN THE IRON TRADE.

AN important step is proposed, writes a correspondent of the *Times*, in connection with the manufactured iron trade of the country. It emanates from the Midland Unmarked Iron and Steel Trades Association, but embraces North and South Staffordshire, Yorkshire, Scotland and Wales, which are the whole of the finished iron producing centres in the United Kingdom. A circular has been issued by Mr. H. G. Mantle, on the initiation of the Midland Association, inviting an expression of opinion upon the question of the abolition of discounts. Answers are solicited to the following questions:—"(1) Should discounts be abolished altogether? (2) Or only partially—viz., on all accounts not paid at latest on 10th of the month following delivery? (3) Should the extra 1 per cent. to merchants be withdrawn? (4) What in your opinion should be the maximum discount (if any) for prompt cash against invoice? (5) Should usual discount and terms of payment be continued to export merchants?" The proposal is a serious one, and will meet with a great deal of opposition from merchants and buyers. It is stated by the promoters of the movement, however, that with the exception of pig-iron every item of importance entering into the manufacture of the finished bar is charged net—fuel, labour, purple ore, scrap iron and puddling mine. The bar maker at present allows 2½ per cent., and in some cases 1 per cent. extra, to certain merchants and others for commission, and this obtains also on the carriage where paid by the consigner. In June last, when the Workmen's Compensation Act came into operation, the Cannock Chase coal-owners, without consulting any one outside their own ranks, abolished the discounts which they had been allowing, and although vigorous opposition was aroused amongst ironmasters and dealers, it has been without effect. Discounts are said to be becoming unpopular, as shown by the fact that the War Office and many engineering firms and railway companies are asking for net quotations. The whole of the replies to the circular have not yet been received, but those which have come to hand indicate a remarkable unanimity of opinion. All the leading firms in the country who were appealed to are favourable to the proposal. Instead of replying individually the members of the Scotch Iron Manufacturers' Association have held a meeting at Coatbridge and decided to reply in the affirmative to questions 1, 2 and 3. Whilst as to No. 4 they reply "one-half per cent. discount," and to No. 5, "net cash against documents should be the terms to export merchants." A list of the names of the firms who will join the movement, which includes all the principal makers of finished iron in Scotland, is given. Another important district, South Yorkshire, has also given its adhesion to the scheme, and the local Bar Iron Association has held a meeting and passed the following resolution:—"That this Association, representing an output of 3,500 to 4,000 tons of finished iron and steel per week, is in favour of the principle of net prices being established." Here again all the leading firms of the district give in their names. The present is a most opportune moment for giving effect to the suggestion. It could only be carried out on a rising market. At the current rate of bar iron the abolition of discounts would represent a gain to producers of about 3*s.* 9*d.* per ton, but to get rid of what has been described as an "absurd anomaly," manufacturers would probably, when the next advance in prices became due, begin to charge net instead of making any alteration in selling prices. By taking this course a slight loss to makers would follow, but it is stated that they would willingly submit to this penalty upon the improvement. A meeting will shortly be held to consider the replies. The majority are already to hand, and fully 90 per cent. are favourable to the principle of net charges. The merchants will naturally oppose the scheme, and the buyers, who are users of the iron for various purposes and who explain that their customers claim discounts, will assist them. The

action of the coalowners in suddenly withdrawing discounts has proved an unqualified success, and now no complaints are heard about it. It is understood that the discounts were originally conceded to induce payment on the 10th of the month following delivery, but now only a few purchasers are so prompt with their cash, and if the payment is deferred until the middle of the second month the 2½ per cent. is deducted all the same.

THE LAW OF TRADE MARKS.*

(Continued from last week.)

THE next point, and by far the most important one that I desire to submit, is the question of word marks. The commercial community of this country demands, and I think is justified in demanding, that a much wider range of words shall be available for registration, and obtain legal protection than the law now defined allows, and that the section dealing with the subject shall be drafted so clearly and precisely that it will be out of the power of the Courts to stifle the efforts of the promoters of such legislation. Word marks are at present refused on the ground that they are either descriptive of the goods—that they are geographical or pseudo-geographical terms—or that they are surnames. I see no reason, and I submit that there is absolutely no valid reason why a manufacturer should not be able to register any word, provided that it can be shown that such word has never been used by any other person for similar goods, and that it infringe no existing rights, and provided that it is not obviously descriptive of the goods themselves, although to some extent it may indicate somewhat of the character of the goods or purpose for which such goods are to be used, for instance, "Pepsalia," "Somatose," "Vi-Cocoa," "Lactopeptine," all of which, more or less, indicate something of the nature of the goods to which they are applied. The word "Vi-Cocoa" is now registered, but between the period of the first application and the actual registration some two or three years elapsed, during which period an enterprising German appropriated this name to himself and registered it in Germany, to the damage of the English company; and I would here point out that one of the great hardships inflicted by the refusal to register words of this nature in this country is that the owner is unable to obtain protection in many foreign countries, where, as a condition precedent to registration, it is necessary to produce a certificate, showing that the mark is registered in the country of origin. Now, as a matter of fact, there are hundreds of marks in use here of great value, and to which the owners have the sole right to the exclusive use thereof under the common laws of the country, and any infringement of the same would instantly be repressed by the Courts. Surely there can be no harm in registering such marks, and there is urgent reason to do so when it is remembered that the owner is cut off from protection abroad until he is registered here.

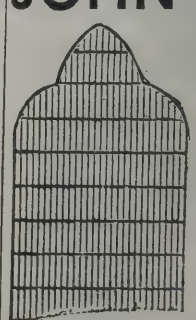
Then, as to the geographical objection, it is surely very absurd to say that a trader shall not use or be able to obtain protection for such words as "Sunflower," "Eureka," "Blackbird," "White Horse," "Elephant," "North Pole," and hundreds of similar words, because forsooth they are geographical names. It is true that the Court of Appeal has decided that the word "Magnolia" cannot be refused registration on the ground alone that it is geographical, but it is also true, as I said a short time ago, that the Registrar, acting for the Comptroller, refuses to be bound by and to follow that dictum; hence I submit the necessity for some amendment.

Again (while, as a fact, the Act says nothing about surnames), many words, while having one obvious meaning to the general public, are rejected on the ground that they are surnames, and, consequently, not capable of registration. Under this head such words as "Swan," "Bull," "Partridge," "Badger," "Throstle," "Crow" and many others are refused registration.

There surely can be no reason why a manufacturer, having adopted the device of a swan to denote his goods, should in registration be compelled to disclaim any right to the exclusive use of the words "Swan Brand," words by which the public know the goods in question, and words which the public use in asking for such goods.

And, while speaking of names, I would for a moment draw attention to the fact that it is provided in the existing Acts that a trade-mark may consist of:—

(*a*) "A name of an individual or firm printed, impressed, or woven in some particular and distinctive manner."



Now it appears to me to be clear that this was intended by the Legislature to provide a means whereby a person or a firm might adopt his or their name as a trade-mark, provided that it was represented in so unique a manner as to render it

easily distinguishable by the ordinary public from any other name of a similar kind. But as a fact this provision is entirely disregarded, and is for all practical purposes a dead letter. Why it should be so is somewhat difficult to understand.

The next provision is :—(*b*) "A written signature or copy of a written signature of the individual or firm applying for registration thereof as a trade-mark."

This provision is in my opinion too restrictive and works harshly on a certain class of the trading community. It is well known that there are numbers of persons who succeed to businesses which have been carried on for years under some other name. These individuals continue to carry on the business under the name of their predecessor and adopt his signature ; thus John Brown might succeed to a business which had been carried on under the name of Jones, Brown & Co., and to change that title or signature would be detrimental, but this gentleman could not under this provision register the signature of Jones, Brown & Co., because although it is the signature he uses in his business it is not his own signature as defined in the Act. Again, a limited liability company really has no signature, and I submit that it would only be equitable to provide in such a case that the seal of such company should be registerable.

Coming to the question of disclaimers as provided under sub-section 2 of section 64, I think it is important that any such disclaimer made under this provision should be limited so that the applicant does not thereby prejudice any common law rights which he may have in the subject matter to be disclaimed, and it ought to be clearly set forth in the Act that any such disclaimer is made simply for the purpose of the registration, and is operative only in so far as it limits the rights of the applicant under the registration itself. I do not think that any objection can be taken to some such provision as this : and, as a matter of fact, the Courts of Scotland have decided in a case recently before them that the applicant had not, by disclaiming the letters "C.B." in connection with corsets, lost the common law rights which he had prior to the registration in question.

Another point which I think requires to be dealt with is the question of costs in an opposition. At present the only power which the Comptroller possesses in reference to costs is that he can award reasonable costs against an applicant who abandons his application after notice of opposition. He has no power to award costs against an opponent who abandons his opposition. This seems very unfair in view of the fact that if the applicant abandons his application he is liable to pay such costs the Comptroller may adjudge. There seems to be no valid reason why costs in an opposition should not go as in other cases, and follow the result in the ordinary course.

The next point to which I think it wise to draw attention is the absolute discretion vested in the Comptroller in dealing with the registration of trade-marks. Under section 62 it is provided that the Comptroller may, on application by or on behalf of any person claiming to be the proprietor of a trade-mark, register such trade-mark, but there is nothing whatever in the Act to compel him to do so, even with an application which complies waw, and to with the lhich there is no objection. The discretion of the Comptroller should be considerably restricted, and provided that an application is in order, and complies with the conditions set forth in the Act, the discretion of the Comptroller to register should end, and the applicant should be entitled to registration without having to go to Court, with the subsequent privilege of paying the Comptroller's costs.

This discretion at present enables the Comptroller to adopt a different procedure with different applicants, and, as a matter of fact, certain trade-marks which are now applied for in the cotton classes are refused registration, whereas marks exactly similar in all respects, and to which exactly the same objections may be raised, are accepted and registered in other classes. I submit that there ought to be an absolute uniformity in connection with all marks, and in connection with all classes of goods.

The last subject to which I desire to call your attention is the position adopted by the English office with regard to the International Convention for the Protection of Industrial Property, signed in Paris in 1883. When the 1883 Act was passed it was contemplated that the English Government would shortly accede to this Convention, and the 103rd section of the Act pointed to some such action on the part of Her Majesty's Government.

Great Britain became party to the International Convention in 1884, since which date British subjects have been able to claim in all the other contracting States the benefits of this treaty, but, curiously enough, for some reason which it is not possible to understand, the Convention, so far as relates to trade-marks, has been ignored.

The subject of this Convention was first brought before the Law Courts on the refusal of the Comptroller to register the words "Syrup of Figs," and an appeal was made from that decision, and tried by Mr. Justice Stirling, who, in giving judgment, used these words :—"Certainly, according to my construction of the Act, it does not afford the means of carrying out the article, and it will, no doubt, be for Her Majesty's Government to consider—and, seeing the Attorney-General here, I have no doubt they will consider—what legislative steps ought to be taken to give effect to that article if necessary."

This very broad hint from one of Her Majesty's judges has also been ignored, and no steps have been taken to carry out this important provision of the Convention.

The matter subsequently came before Mr. Justice North in another appeal in what is known as the "Carter's Little Liver Pill" case, when Mr. Justice North decided that the Convention entered into between Great Britain and the United States could not be enforced in the English Courts, and the Attorney-General (Sir Richard Webster) protested against either the Convention or the protocol being read, using the following words:—"The Court can only receive their direction by statute, unless there is some right by common-law principles, and except for the purpose of inducing your lordship to take the view of the statute, which I most respectfully submit is not open to you to take, this Convention and protocol ought not to be read." And further, "If there is any ground for complaint it is a matter for diplomatic interference and cannot be enforced in these Courts."

The fourth paragraph of the final protocol comprises the essence of the whole matter, and it is this which the Patent Office hesitates to carry out, and which, to my mind, ought certainly to be carried out in the form in which it has been adopted in the Convention. The paragraph reads as follows :—

"Paragraph I. of Article VI. is to be understood as meaning that no trade-mark shall be excluded from protection in any State of the Union, from the fact alone that it does not satisfy, in regard to the signs composing it, the conditions of the legislation of that State, provided that on this point it comply with the legislation of the country of origin, and that it had been properly registered in said country of origin. With this exception, which relates only to the form of the mark, and under reserve of the provisions of the other articles of the Convention, the internal legislation of each State remains in force.

"To avoid misconstruction, it is agreed that the use of public armorial bearings and decorations may be considered as being contrary to public order in the sense of the last paragraph of Article VI."

It has been contended that if this provision were properly carried out, it would enable applicants from those foreign States where the regulations as to trade-marks are very lax to register in this country such words as "Bitter" for beer, "Black" for coal, and many other common descriptive words. As a matter of fact this is not so, because an applicant under the Convention would be entitled to register any trade-mark in Great Britain which by registration would curtail any of the existing rights of British subjects.

The strongest argument employed against the adoption of this construction of the Convention is that it would be manifestly unfair to give foreigners any privileges with regard to registration which are denied to English trade-mark owners, but I cannot see that there is anything very unfair in this, when it is remembered that foreign countries adopt exactly the same course towards British subjects, and although some foreigner might register a mark in England which would be refused to an English applicant, similarly English firms in foreign countries can register under the Convention trade-marks which would be refused to the inhabitants of those countries.

I further submit that if this argument has any basis at all, it is rather late in the day to bring it forward, and it ought certainly to have been discovered before the Convention was entered into. I have not yet heard a single argument adduced against the adoption of the provisions of the Convention, which will, as a matter of fact, bear the light of day. The only objections are really matters of sentiment, and I think, as a matter of common honesty, the Government ought to take some steps to carry out the agreement into which they entered in this respect.

I think the reasons I have adduced are sufficiently reasonable to support the demand for an amendment of the existing law on trade-marks, and an amendment of a character in accordance with the just and well-known desires of the whole trading community.

PROPOSED WORKHOUSE AT EASTBOURNE.

AT the meeting of the Eastbourne Board of Guardians on the 16th inst. the following recommendation of the buildings committee was brought forward :—"That it is expedient to build a workhouse, not including an infirmary, on the site secured for the purpose at Polegate, and that Mr. F. G. Cooke be instructed to submit plans and estimate of cost to the Board on the earliest convenient date."

Mr. Maude said that the inspector gave them to understand that an attempt to rebuild the workhouse would not be approved by the Local Board. On the strength of that they looked about for various sites, and had a full report from Mr. F. G. Cooke. They then got Mr. Gorringe to attend an auction, and he bought the site of which they were now in possession at a very reasonable figure, compared with the amounts asked with regard to the other sites which were inspected. They afterwards inspected the Polegate site, and they had trial holes sunk to ascertain the best situation for a workhouse. It was then found that three landlords had a right-of-way over the site, and the Board decided to purchase the necessary land from each of those landlords to secure that right-of-way. They next got plans from Mr. Cooke, architect, who was present with a block plan showing arrangements for a complete workhouse and infirmary. The Board had, therefore, practically committed itself to build a workhouse, but it was not stated in so many words in their minutes, and it was necessary that a formal resolution to this effect should be recorded. Mr. Cooke had estimated that the present workhouse would realise from 9,000*l.* to 10,000*l.* If they sold the site of the workhouse without the chapel and infirmary it would be 47,000*l.*

Mr. Petherbridge suggested that other architects should be invited to send in competitive plans.

Mr. Maude said they were wasting the time of the committee and of Mr. Cooke, the architect, and they were wasting the ratepayers' money. Moreover, it was proposed, now that Mr. Cooke had prepared plans in consultation with the committee and others, to throw him over, and that, he argued, was not treating Mr. Cooke fairly.

Mr. Champion proposed that the committee be instructed to insert advertisements offering prizes for competitive designs for the new building.

The Clerk said Mr. Cooke was appointed architect to the Board about 1882 or 1883. That was his official title, and he had done their work since that time. Mr. Cooke had been acting in touch with the Local Government Board in the preparation of these plans.

Mr. Maude and Mr. Crake pleaded that it would be an injustice to Mr. Cooke to accept this amendment, but it was carried by 11 votes to 4.

The Clerk, appealed to as to the relations of the Board with Mr. Cooke, said the latter was in the position of the Board's consulting architect, and he had had instructions to prepare certain plans. If the Board now desired to appoint another architect they could do so.

Mr. Maude protested against this treatment of Mr. Cooke. It would be better far to dismiss him.

Mr. Cæsar moved, "That in all cases where tenders are invited for work in contemplation detailed specifications shall be drawn up, and after approval by the committee responsible for the carrying out of such work, copies supplied to each firm from whom tenders are invited."

Mr. Hamblyn seconded, and the words "by the clerk or architect" having been inserted in relation to the drawing up of the specification, this was agreed to.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

APPLICATIONS FOR PATENTS.

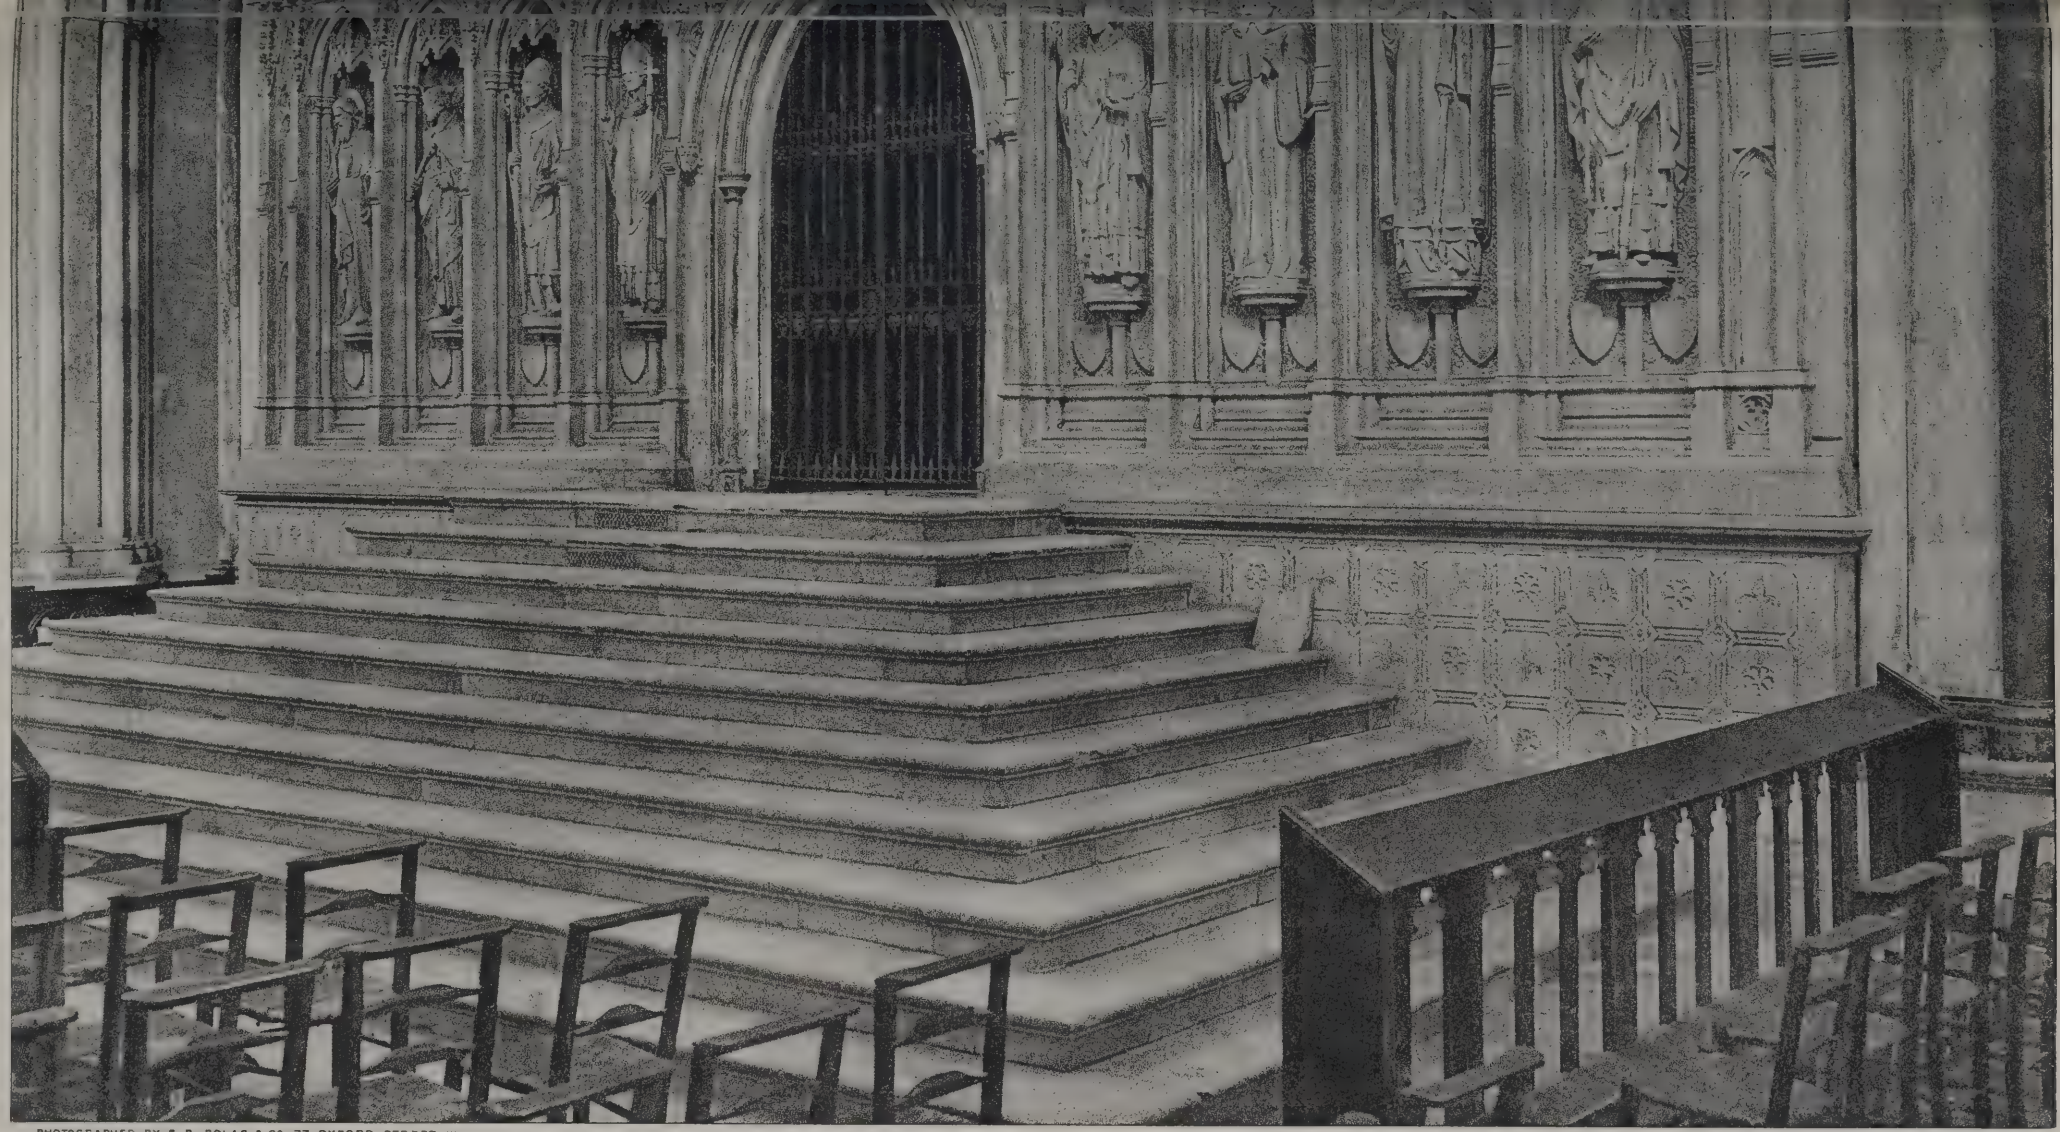
11615. Thomas Price, for "Improvements in the manufacture of window sashes and frames, and in the means or mode of securing the same, and for doors, safes, and the like."

11669. Johann M. Tietjen, for "A window cleaning appliance."

11712. Rudolf Tellenka, Johann Kolbinger and Stefan Hagyiristic, for "Improvements in moulds for casting magnesium compositions and similar cements."

11805. Thomas Rouse, for "Improvements in the manufacture of concrete and artificial stone for building, paving and other purposes."

11844. Wallace Galrey Thomson and Joseph Edward Prosser, for "An improved paving and flooring block."



TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

The Architect.

THE WEEK.

ALTHOUGH Mr. BODLEY'S reference to his essay on "The Examination Test" at the meeting of the Institute on Monday will be interpreted as a confession of error and a revocation of conclusions, we hope his words were not intended to have that meaning. Since 1892 nothing has occurred to make the examination test an infallible means for the discovery of architectural skill. It is still true, as when Mr. BODLEY wrote, that "an architect should possess certain mental qualifications, of which a sense of the poetry of his art is perhaps the most important." Mr. BODLEY considered that a poet could not be tested by asking him questions, or his imagination revealed in that way. He introduced COLERIDGE'S expression about a great Gothic steeple which "seemed to be sent up to heaven like an unperplexed question." His comment on the words were as follows :—"This is a fine and true description of architecture in one of its highest forms—the absence of all hesitation and uncertainty of design, the effect of entire unity of idea and of a single great harmonious conception, is finely and poetically expressed. But these are qualities which in their degree are necessary to an architect for every work, be it great or small, and it is superfluous to point out the futility of any attempt to test them by examination. These so-called test examinations are a modern danger in many lines of life, and the world is already beginning to understand that this is so. Let us not bring the danger into the region of the practical art of architecture, but teach its principles and practice in the better manner of old days. It is only in such a way, we think, that our beloved art of architecture may be raised to the level on which we would have it for future, and we may hope for more artistic times." By acceptance of the Institute system Mr. BODLEY nullifies his former reasoning, and it is difficult to say which view we are to take. There is, however, more cogency in that of 1892. Like the starry GALILEO before the Inquisition, Mr. BODLEY may have muttered on Monday night, "E pur si muove!" but the inconsistency between past and present still remains.

IT was fear of another attempt on the part of individuals to carry out the continuation of the Embankment from the Houses of Parliament to Lambeth Bridge, and to introduce many improvements in the neighbourhood, which caused the London County Council to agree to the scheme, although it was only partially debated. There is no doubt the present condition of that district of Westminster is not in keeping with the importance of the Houses of Parliament. But it is not easy to discriminate between the part which is a local improvement and the part which is metropolitan and national. The company formed a couple of years ago would have taken all risks. The recoupment would, of course, be derived from the improved value of the building sites which would be created. It was too generally assumed, however, that the expenses would be insignificant and the profits enormous. As a consequence the Bill did not receive the support to which it was entitled. It is now stated that the total expense which will fall upon the metropolitan ratepayers will be only 180,000*l.* That assumes large contributions from the Government, the Ecclesiastical Commissioners and the local authorities. The new sites which will be one of the results must be valuable, and it is not certain who is to be enriched by them. Apparently the Metropolis will have to sustain an increased burden, which might have been avoided if the work were left to private enterprise.

IF in England we have reason to be apprehensive about the failure of the supply of coal, the Americans have to meet a probability of failure of wood within a much shorter period. Although from the pictures given in travellers' books and railway guides it might be supposed the United States were covered with forests, yet it is well known that the supply of some varieties is very limited. Spruce is one of them, and it is in demand for framing, especially in the Northern States. A "cord" of spruce in the form of joists and studs is worth about eight dollars, but if worked into paper pulp it acquires a value of thirty-five dollars, or more than fourfold. It is therefore more profitable to decline the appeals of carpenters and builders, and to grind spruce into powder. There is spruce in Canada, but the import duties keep it out of the States. As it is calculated that about 400 acres of spruce are daily required for consumption the existing forests cannot long endure. More expensive timber, such as yellow pine, will have to be substituted in building, but the quantity to be found is infinitely less than of spruce. Sooner or later foreign supplies will have to be invoked unless the ingenious steel manufacturers may be able to supply a product which can be substituted for timber and will cost less money.

THE Sheffield Society of Architects have already arranged the programme of papers which are to be read in the next session, viz. :—November 14, "Some Old Derbyshire Houses," by J. R. WIGFULL; December 12, "Oriental and Indian Architecture," by Professor T. ROGER SMITH; January 9, 1900, "Suggestions for Dealing with the Law as to Light and Air in Building Cases," by T. WALTER EMDEN; February 13, "A Parish Church," by C. HODGSON FOWLER; and March 13, "The Architecture of the Fifteenth Century and Early Tudor Period," by C. M. HADFIELD. It is also hoped to arrange during the summer for excursions to Derwent and Langsett.

A PART of the property of the Colmore Trustees having been acquired in order to enlarge the Council House at Birmingham, the question now arises, what is to be done? By the conditions of the lease a sum of 100,000*l.* is to be expended on buildings. Most of the departments have applied for an increase of accommodation. For example, the museum and school of art committee state that the present Art Gallery is considerably overcrowded, making it impossible to properly display the present collections, and militating against further gifts to the Art Gallery; and they have already informed the Council of the offer by Mr. J. T. MIDDLEMORE of several pictures of considerable value, on condition that a new and suitable gallery is provided. After careful consideration, the committee have come to the conclusion that the accommodation immediately required can be provided with the least disturbance of other departments, and with the greatest convenience to the public, by provision being made on the new site for the health and water departments, leaving the rooms now occupied by the former, which are principally in the basement and on the topmost floor, for the extension of the public health department and the accommodation of any committees requiring small accommodation only. The total floor space estimated by the museum and school of art committee to be requisite for a new art gallery, which, for lighting purposes, will necessarily be over the proposed health and water departments, is about 16,000 square feet. If the general proposal now submitted be approved by the Council, the committee will consult an architect qualified to act as assessor if the Council should hereafter determine to obtain plans by competition, and report further when he has advised them upon the various preliminary points that must arise.

THE building in which the annual exhibitions of pictures will be held next year in Paris is estimated to cost half a million of francs. As we have already said, the site is on the ground in the Avenue de Breteuil once occupied by the abattoirs of Grenelle. The outlay is large for a temporary building, as artists expect that the palaces of art which form part of the buildings for the International Exhibition of 1900 will be assigned to them for 1901 and succeeding years. The Government may, however, intend to use the palaces for the display of a different class of objects. M. LOVIOT, in his plans for the buildings at Grenelle, has adopted the arrangement of a double row of salles, which are sixty-six in number, around a garden which will be partly covered. The salles will be for the pictures and drawings, in the garden the statuary will be displayed. The plan is a development of that of the transformed machine gallery in the Champ de Mars, but there M. LOVIOT was hampered by the piers which carried the big roof, while at Grenelle he has a free area of 33,000 square metres to deal with. The principal entrance will be on a semicircular plan, from which avenues will lead to the galleries.

ARCHITECTS' FEES.

THE mock modesty which is one of the national failings is exemplified often in the payment of fees for professional services. Barristers and physicians cannot recover money for their work unless they were employed under exceptional conditions. The President of the College of Physicians would lose his case if he brought an action for visits to an invalid; but if he were to charge ten guineas for a modicum of Epsom salts or a small box of bread pills, the law would respect his claim. A lawyer might be able to charge as much for a sheet of foolscap on which an opinion was inscribed, but the Bar Committee would not recommend the experiment. Both professions have to suffer through the existence of a fallacy which is based on an erroneous belief about the custom in ancient times. There never was a time when the skilled adviser was under an obligation to render services without any return. When by a refined hypocrisy the dealings and by an accepted fiction the payment were not above board, many evils arose, as is always the case with transactions which are veiled. One of the excuses made for the misconduct of Lord BACON is that in his acceptance of bribes he was not unique, for other judges had also itching palms. Yet in his day the members of the Bar formed an exalted class, and were supposed to be inspired by lofty motives. The practice of receiving fees was supposed to be a toleration of the humble offerings of clients' gratitude, and in all cases did not cease when the advocate was raised to a higher position. The clergy complain of worse treatment than either lawyers or physicians, and the ease with which it is assumed that the offer of more than a nominal sum for some of the functions in which they have to take part would be an offence, is one of the causes of the poverty which afflicts many excellent ministers.

Architects cannot count on the sympathy which is felt for clergymen, lawyers and doctors. Their use is not generally recognised. It is very rarely that the services of an architect are dictated by an Act of Parliament. A trustee runs less risk by going direct to a builder than by obtaining the aid of an architect and surveyor. As a rule English law expects something material to be supplied in business transactions whenever money has to be paid. The architect prepares plans and other documents, but he only lends them, and his ownership never ceases. In spite of all the cases which have come before the Courts, the architect's position is not yet clearly understood. A lawyer may enjoy the dinners given by architects, and occasionally assist at a meeting, but he is apparently unable to realise the whole extent of the work which is paid for by a commission of 5 per cent. on the outlay. He sees a large number of houses and other buildings which resemble one another, and he concludes that one set of plans can be readily adapted to serve for all. If he should be engaged in building cases, and is compelled to glance at specifications and conditions of contract, he takes it for granted they are like many legal documents drawn from printed forms by writing clerks. He admits the existence of an organisation in every office, but the more perfect it becomes the less is the need for skilled services. Whenever a barrister delivers an address in a case in which an architect is concerned, or when a judge deals with evidence, it is easy to perceive that he believes in routine as the basis of the architectural profession.

As long as there is a belief of that kind, however erroneous it may be, it affects the judgment. Routine means, to some extent, mechanical production, and all who have had experience with lawyers know how difficult it is to convince them of the mental labour which designing involves. The best building is commonly supposed by them to be only an adaptation of another building, or of several, a feat which can be accomplished by assistants who receive modest salaries. A barrister engaged by an architect is therefore disposed to compromise from the opening of the case, for he has the conviction that whatever sum is offered will pay for the services which were rendered, and he knows there is a general prejudice which no logic can overcome. The extent to which prejudice can go was exemplified by the late Lord BRAMWELL, a judge who generally was dominated by common sense and indisposed to hair-splitting. Yet when a man who was without the connection with a church which once sitting on a free seat might confer implored the committee not to entrust the restoration of the building to the architect appointed, because he was a Wesleyan, and was bound to tamper with it and cause irreparable damage, his lordship held the letter was not a libel. When we recall the fate of many actions for fees in which architects were plaintiffs, one must wish that what Mr. Justice BAILEY said about barristers' fees should be no less applicable in all commissions to architects :—"They are to be paid beforehand, because they are not to be left to the chance whether they shall ultimately get their fees or not, and it is for the purpose of promoting the honour and integrity of the Bar that it is expected all their fees should be paid when their briefs are delivered." The honour and integrity of the Bar would, we presume, be difficult to uphold if the payment of fees were deferred to an indefinite time, but what would be the effect on barristers of such a vicissitude as has fallen on the plaintiff in START *v.* West Mersea School Board, a case which came to an end on Saturday last? Mr. J. W. START, of Colchester, was in 1897 asked by the Chairman of the Board to prepare plans for the enlargement of the West Mersea schools. As economy was desirable, it was arranged that a clerk of works was not to be employed. The additional labour was to be undertaken by the architect, who was, moreover, to accept a reduced fee of 4½ per cent. Here we may remark that any concession of that kind is not advantageous to an architect should an action arise. It confirms the notion that fees are elastic, and it is only necessary for a client to be resolute in order to have them reduced. The drawings were prepared, and the usual procedure followed. Tenders were received in due course, but they were found to be larger in amount than was anticipated. The School Board declared that the understanding with the plaintiff was to have the expense of the enlargement limited to 3,000*l.*, and afterwards the reduced sum of 2,000*l.* was fixed. On that condition the appointment rested, and when it failed the liability of the School Board came to an end. Plans were obtained from another architect, according to which the work was carried out. Mr. START's plans being of no avail the Board declined to pay for them. The jury showed some consideration for the architect. He claimed 473*l.* 5*s.* 8*d.*, and in a case of the kind it is generally considered allowable to charge for attendance at meetings, consultations, &c., which otherwise would be included in the percentage which is agreed to be paid by equitable clients. The jury considered the plans to be of some use, and as it is well for a Board to be assured about the necessity of restricting their projects, definite information on that subject is worth paying for. The jury were not unreasonable in awarding plaintiff 150*l.*, or less than a third of the amount claimed.

The School Board might well have been content with their success. But one of those pleas was set up which are always received with disfavour by English judges, although bound to admit them. It was contended that there could be no right to recover any sum because the contract was not under the seal of the School Board. We have several times warned our readers about the danger which lurks in the ruling case HUNT *v.* Wimbledon Local Board. But it must be admitted that to demand a sealed document would in many cases be taken as a slur on the good faith of a public body, and an architect in consequence might be placed in a precarious position. If a contract must be sealed, and is not, it ceases to be a contract. Vainly plaintiff's counsel maintained that the uses which the plans served were completed, and therefore the money was owing for a benefit already derived and a contract that was executed. Mr. Justice WILLS could only express his regret that the plea was raised, for he could not sympathise with it. There is not probably one experienced judge who would differ from his lordship. But the law cannot be set aside by those whose duty is to administer it. Mr. Justice WILLS admitted there was no express contract between the parties, and, indeed, one is rarely entered into in such cases. Architects have to be satisfied with resolutions which are recorded in a minute-book, and of which copies are not always given. His lordship could only set aside the verdict of the special jury and give judgment for the School Board.

The case is not uncommon. In its circumstances it corresponds with a great many which occur throughout the

country. There is a competition which is not announced. When, as in West Mersea, the erection of a building is contemplated, or an alteration of it, sketches and drawings are prepared in the expectation that one day they may be useful. Their existence becomes known to those who are in any way responsible for the building, and if one architect is superseded another is ready to take his place, and unless the town is very small there are several available. At one time an architect in Mr. START'S position would, after the receipt of the tenders, be asked to modify his plans, and to turn to account the experience about cost. But private and public building-owners have so many interests to satisfy, they now prefer to give a chance to as many architects as possible. In that way they believe all the advantages of competition are gained without expense or trouble to themselves.

MUCHELNEY: A RETROSPECT.

BY R. C. AUSTIN.

ENSHRINED amidst a matchless tradition, which merges imperceptibly from the legendary into the concrete of the actual; now obscure and well-nigh indistinguishable, then breaking out with the meteor flash of a comet, illuminating for an instant the surrounding objects with startling clearness, and with its departure leaving a gloom all the deeper by contrast in Somersetshire.

Nature, history and art have united to weave a spell over this fair county, which it would be difficult to match, impossible to surpass.

The face of nature is ever changeful, but in this comparatively small compass she has been truly bountiful. Rugged pine-capped ridges and rocky cliffs open into broad plains and fertile valleys, which gently lead into sedgy moors, where of old the lake-dwellers lived their isolated lives.

Of late years the industry of man has reclaimed these peaty marshes and transformed them into pasture lands, and now cattle graze and crops flourish where formerly the sluggish tides lapped the bases of the surrounding hills; churches and hamlets alone remain mute witnesses to the expulsion of the waters.

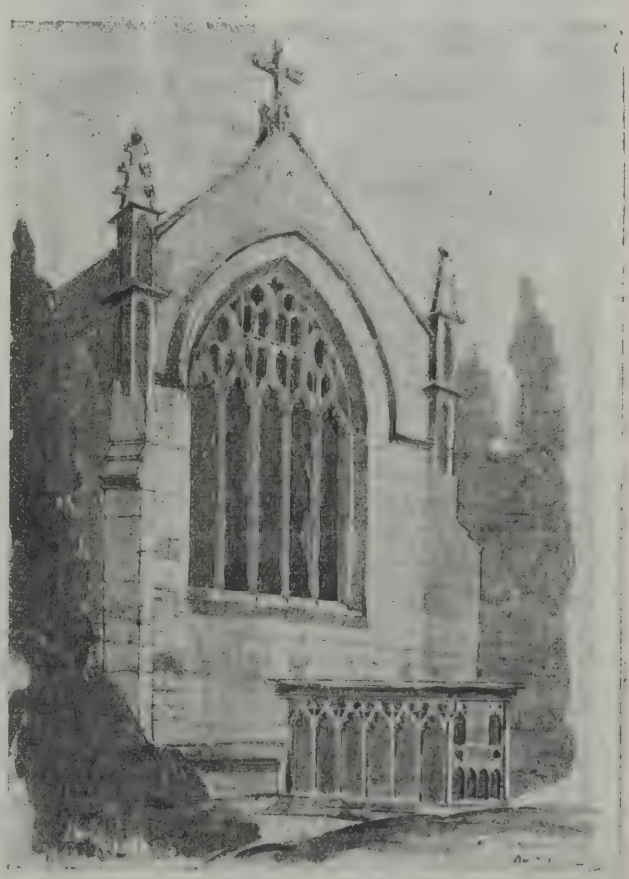
Our ancestors were in nowise slow to avail themselves of nature's benefits, and the village of Muchelney is no exception to the general rule. Formerly it was easily accessible by water from Langport; now, some five miles off the beaten track, it is more or less exempt from the attentions of the tripper and the relic hunter.

To the artist it is indeed a Mecca in which to dream of unattainable ideals, and let fancy wander unchecked along the vista of bygone centuries, every stone speaking to us in no mute language against our haste and preoccupation.

If we would but occasionally turn into such villages for a space of time we could learn much from the buildings which our ancestors raised—a tribute to the mighty power working within them; striving to find expression in battlemented tower and fretted tracery, the perfect union of strength with weakness, the one supporting and helping the other, and thus exemplifying a divine law which man has disregarded.

But this is a digression.

All around Muchelney are flat, reclaimed moors, watered by the river Parret, no doubt an unimportant stream in itself, and scarcely worthy the name of river, but extremely picturesque in its own quiet way, its surface covered with lilies and arrowheads, in which the water wagtails hunt their prey. The banks are lined with reeds, the haunt of the moorhen and other wild-fowl. The roads leading from Drayton and Huish Episcopi are on the outskirts, suggestive of the architectural beauties which are to follow. Old houses greet one at every turn, with picturesque thatched roofs and mullioned windows; bricks are only seen in the chimney stacks; these replace the older Ham stone chimneys, which, unfortunately, have not withstood the ravages of time.

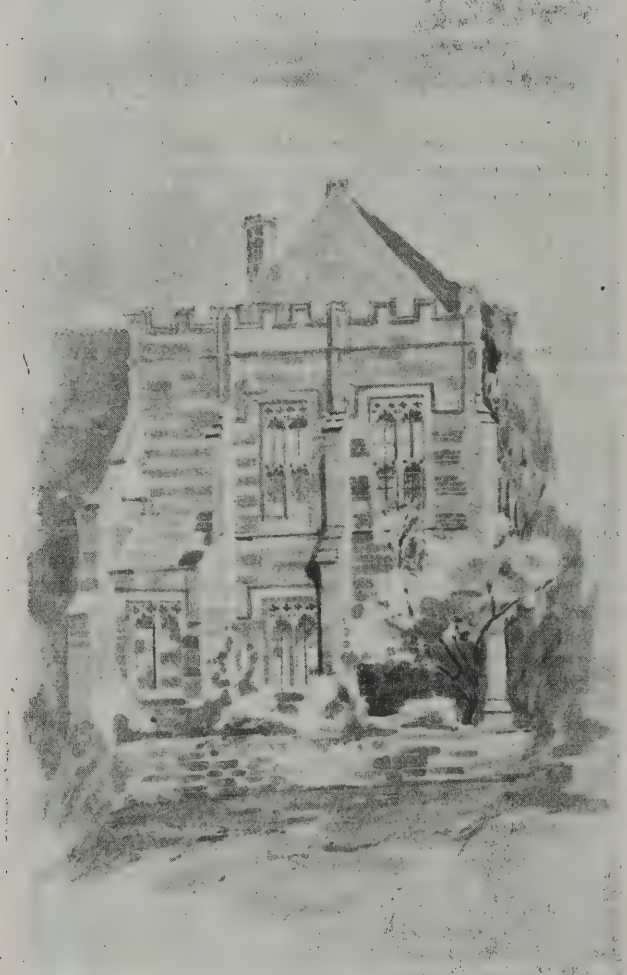


The market cross, the centre of interest in the village, stands somewhat on the outskirts; its date may be attributed roughly to the fifteenth century. The cross itself is curious in having drill-holes in the round lobes which terminate the arms. I was unable to discover the origin of these marks. The pillar on which the cross stands is a square diminishing at the top, which is surmounted by a crow's-foot gable with fleur-de-lis terminals, on which the cross stands. The base of the column is a rather high octagon, with panelled recesses in each face.

This base stands on tiers of shallow octagons, which probably formed seats for open-air services.

The material used is Ham Hill stone. Almost opposite the cross and church is the vicarage, a most interesting building, built in the latter part of HENRY VII.'s reign.

The original plan can be clearly traced, but the fine effect of the hall is spoilt by partitions and the addition of a second-floor. The tracery in the hall window is of most delicate design. This appears to have been a very favourite one, as it occurs again in the Abbey in a slightly modified form. The entrance door opening into a passage between the buttery screens is the original one. The back of the building is unfortunately in a very bad state of repair, and it has been found necessary to shore the walls in two places where the stonework has badly bulged. There has been a project on foot to pull down the whole building, but it is to be hoped that it will not be seriously entertained. The old stone-slabbed roof has been replaced by a thatched one; unfortunately it rather dwarfs the masonry.



Opposite the vicarage is the church, which originally formed part of the monastic buildings. Two large yew trees in front of the north porch add greatly to the pic-

turesqueness of the churchyard. The church is now entirely disconnected from them save for the foundations, which were uncovered some time ago, and give some idea of the extent of the ground covered by the monastery.

The building standing at the back of the church is the abbot's house, now converted into a farmhouse. It remains almost intact. One wall formed part of the cloisters; this is shown by the springing of the vaulting, which is still in position.

The house, unfortunately, is not shown to visitors. It boasts a drop threshold in one of the sleeping apartments; the tracery in the windows is as sharp as though chiselled yesterday, and the remainder of the stone is in wonderfully good order considering the small amount of care bestowed upon its preservation.

The parapet is crowned by a deeply-moulded battlement of unusual section; the pilasters above the buttresses remind one of work in the Chaingate at Wells; both works

were in all probability being carried out at the same time, as the monastery was in close connection with the Wells chapter.

The "White Ways" were a peculiar feature in the history of the monastery; they were stone-flagged paths across the moors. Where dykes stopped the way, they were bridged over with stone. The reason for the name "White Ways" was probably that the stone showed clearly by night and day; only one now remains; originally they diverged in all directions from the monastery, and formed, as it were, a gigantic spider's web with connecting links uniting the radii; these paths also served for landmarks as well as passages for the monks when on some long journey which necessitated travelling by night. A great part of the monastic buildings still remains unaccounted for, and much of the foundations recently brought to light forms a subject of debate amongst antiquarians.

The abbot's hall has been converted into a barn. It is of rather earlier date than the house; on one of the outer walls may be traced curious inscriptions which are supposed to have been executed by a monk who was confined for some offence. The houses in the village are very much scattered; from end to end forms a pleasant morning's stroll. The low thatched cottages are very delightful with their three-light stone-mullioned windows and hood moulds returned down the sides. These windows are a typical feature of this part of Somerset, and are to be seen in almost every village.

Another local peculiarity is the entrance doorway, which is the usual flat four-centred stone arch common in this style, but the hood mould is about one foot six above the arch and forms a square head. The whole effect is rather unusual. This feature is more frequently met with in manor houses than in cottages.

I caught a delightful glimpse of a manor house standing right on the outskirts of the village—a two-storeyed building with mullioned windows.

The casement fasteners are of very elegant design wrought-iron, terminating in a tightly-coiled spiral.

The gable end of the wing facing the road has a fine mullioned window in the centre of its wall; beneath are panels enriched with cusping.

The wall of the return wing is supported by sturdy buttresses. I could not see any windows between them. Probably this part of the building is intended for the granary.

Both doorways in this building are worth attention; they are very characteristic of the style.

Far off one can see the tower of Huish Episcopi rising, its fretted sky-line just appearing above the trees; like Muchelney, it seems to be wrapped in foliage, and indeed the churches are similar in many respects. The tower may have been copied from its neighbour, or rather they influenced each other, as they appear to be about the same date, Huish of course taking precedence of its more humble rival by reason of its size and the beauty of its detail.

The tracery in the chancel windows of Muchelney Church is very good; the hollow moulding in the jamb is very effective. The builders in this district seem to have taken great pride in their tracery; it is worked with the minutest care, and the effect is a perfect finish without any sacrifice of boldness.

The Crucifixion over the chancel gable and the flanking pinnacles are not carved with the same degree of finish as the remainder of the work; in fact, the pinnacles savour of churchwarden restoration. But if this is the case it was done so long ago that the stone has weathered to almost the same colour as the rest of the fabric.

There is a beautiful cross on the gable wall separating the chancel from the nave.

The churchyard is most interesting, as on the south side there are considerable remains of the monastery foundations. One wall is still standing to the height of about 2 feet, with an attached tomb of an abbot. The effigy is in a fair state of preservation, and is partially supported on modern brick piers. Near this figure is a beautiful piece of tile-paving in situ, covered for protection from the weather by a piece of glass. The tomb is also covered with a rough zinc canopy; close by, towards the south-east of the church, are the remains of a circular building.

It is with reluctant steps that one leaves this county, stored with memories of past greatness, and breathing an old-world charm, now, alas! becoming rare. So much the more should one strive to capture it and hand it down to the generations yet unborn, that English traditional architecture may not be entirely lost sight of amidst the chaos of wrought-iron girders and smug middle-class houses hemming us in on every side, to the exclusion of all that makes our city life endurable.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

ON Monday evening last the concluding meeting of the session was held. As it was known that Mr. G. F. Bodley, A.R.A., was to receive the Royal Gold Medal, an exceptionally large number of members attended, including some of the surviving gold medallists—viz., Sir A. W. Blomfield, Messrs. Waterhouse, R.A., Brooks and Ernest George.

Owing to the absence through illness of Professor Aitchison, R.A., the chair was taken by Mr. W. M. Fawcett, senior vice-president.

A letter was read from Sir L. Alma-Tadema, R.A., expressing his gratitude for the vote of thanks accorded to him by the Institute on his knighthood.

Presentation of Royal Gold Medal.

Mr. Fawcett said:—It is with great regret that you will all hear that our president is laid up and under the care of his doctor, who absolutely forbids his venturing here to-night. I hope his illness is not dangerous, but he is told that he must not on any account move about. I particularly regret it, for it would be much more satisfactory to you all if the Royal Gold Medal had been presented by his hands rather than by those of a country cousin, whom for the last few years you have honoured with a place on your council. There is one reason beyond that of being your senior vice-president which makes me not entirely out of place. I have known Mr. Bodley far longer than I have known anyone in this room. It was, I think, in 1852, when I was little more than a boy, that he came to Leeds to help a friend of his long since passed away. I well remember how he graphically described the delivering up of the drawings in some verses, which I fear are now absolutely lost to posterity. If long acquaintance, and I hope I may say friendship, is any title to the honour I feel in presenting this medal, I think I have perhaps shown that I possess it. I have also the further title in that I have always been a great admirer of his work, feeling that he is indeed a true artist whose designs and conceptions will receive the approval and admiration of generations yet to come. We have the further pleasure of welcoming Mr. Bodley among us as a Fellow. We all know the broad view taken by this Institute with regard to the profession—that there has never been any wish to coerce architects to join us, although we believe that the action of the Institute has been of great value not only to the architectural profession, but to architecture as an art. Feeling this, we cannot but rejoice in numbering Mr. Bodley in our ranks. Mr. Bodley's work is so well known to you all that it hardly needs comment from me. Soon after leaving Sir S. S. Scott's office he commenced practice on his own account, and St. Michael's Church, Brighton, was one of his early works. At this time he was feeling the monotony of the work done—he must have felt as what I have heard described as Gothic "revived but not revivified"—and, after some travel abroad, he evidently felt relief in the change to French work, and hoped to get life by working freely with it. This phase did not last long. He soon felt that mere variety was not life. He was a young man striving for the light, but he was also a strong man, and, like a great ship which requires the buffeting of a voyage to let it settle down in its true lines, it was necessary for him to pass through a struggle of this kind before he could grasp his work and give life to our own English Gothic. How far he is personally sensible of this I can hardly say; I am speaking as to how it appears to a brother architect. St. Martin's, Scarborough, was another of his early works where the French idea is less pronounced, and where we can feel the influence of the Priory of Kirkham not far off. All Saints' Church, Cambridge, which was built in the early sixties, has no trace of this French fever, which by this time has passed quite away. It is impossible here to enumerate and describe all the buildings he has carried out, but I may mention the church at Clumber for the Duke of Newcastle as a particularly fine work. The church at Eccleston for the Duke of Westminster is, if possible, more successful. It is hardly finished, as the screens and reredos are not yet fixed; but it has been an opportunity for carrying out a complete work with all its accessories, and the unstinted and munificent wealth of the donor has probably not made the successful result less difficult. In quite a different style is the church for the Cowley Fathers at Oxford. There the work is remarkable for its quietness and simplicity, but what a grand simplicity it is! It is not in church work alone that Mr. Bodley has won his laurels. The Eton Mission Hall at Hackney Wick, the King's College, Cambridge, and the restoration of the library at Christ's College, and many other buildings, show the same delicate care, the same longing for simplicity, truth and repose. The Deans and Chapters of York and Peterborough may be congratulated on having called in Mr. Bodley to take charge of the repairs in their cathedrals—repairs under which such delicate questions arise between the antiquary, the pure artist and the practical architect. Mr. Bodley has also shown great power in carrying out decorative work, both in colour and in that of a monumental kind. Of the latter I need only mention the tomb of Archbishop Thomson at York and that of Bishop Woodford at Ely, both of them showing great power of design and wonderful care, even to the most minute detail. He has shown also in colour the intense knowledge he has of its value when properly applied, and he has also shown how to handle it. I should be inclined to place this knowledge and management of colour as perhaps the highest of his artistic faculties. It is, therefore, with feelings of great pleasure that I have the honour of presenting the Royal Gold Medal to Mr. Bodley, and I am sure that all our members feel also the honour of having such a distinguished artist among us.

Mr. Bodley, in reply, said:—In more ways than one I am unprepared to say anything to you to-night, for I have been labouring under a mistake. I thought that to-night we were to have a pleasant family dinner, or rather a club dinner of the Institute, and that to-morrow was to be the day for speeches. So I was thinking that when I got home to-night I would think of something to say to you. I have not had the opportunity of doing so. Gentlemen, this honour that you have given me was as unexpected as it was unsought. Indeed, I may not have been quite respectful to the Institute, for it is not many years ago that I took part, with Mr. Norman Shaw, Mr. Jackson and others, in writing a paper arguing against the Institute's idea of examination being used as a test for the profession of architecture. Our feeling, and our one feeling, was that it might tend to make the profession and our work less that of an art, and too much that of a profession. Gentlemen, I think I owe this honour of receiving the Gold Medal more especially to my great love for that style of architecture which I have always held, and do hold, to be the most beautiful style—I mean the English Gothic of the Middle Ages. I believe that this style is like Greek work in its great refinement and great delicacy. Architecture then reached a perfection of which we have hardly a perception now. Our work is so confused, so mystified by many styles. In old days there was unity of feeling, and I cannot but think that the more we can hark back and try to use one style the better it would be. This may be Utopian, it may be impossible; but what a thing it must have been in those days not to have muddled in selecting a language to speak in. There was one language; for, after all, style is only language. If a Frenchman has anything to say he will say it in French, if an Englishman in English, a German in German, and so forth. And now we think so much of our styles and do not think enough of what we have to express, what we have to say, what we have to tell the world—and that is, that nature is right, nature is beautiful, and that architecture and all the arts have been established and built up, generation after generation, by the traditions of the past. I think we are rather too apt to ignore that, and are apt not to think enough of principles; I mean such principles as that of truth, and above all perhaps of refinement. For I do believe that that is a thing that is lacking in the present day in our architecture. Our buildings have grown. You know as you go through the streets of London how you see them growing. Have they grown in refinement? For in all arts—literature, painting, architecture, sculpture—you want that refinement and nicety, and it is that which makes the real and living work of art.

Mr. Aston Webb, A.R.A., proposed a vote of thanks to Professor Aitchison in recognition of the admirable manner in which he had discharged his duties during the preceding term of three years. It was seconded by Mr. H. H. Statham, and carried with acclamation.

The New President.

Mr. Fawcett then offered his congratulations to Mr. William Emerson, who had been elected to the highest dignity it was in the power of the Institute to bestow.

Mr. Emerson, in returning thanks, said that although the members had honoured him by election, it was with trepidation he would enter on his duties. He had been a member for about thirty-two years, and had filled various offices, yet he could not be forgetful of the eminence of his predecessors in the chair. He looked for a continuance of the kindly consideration he had already received, and with that expectation he would endeavour to carry out his duties to the best of his ability.

A collection, mainly of photographs, of buildings by Mr. Bodley was exhibited, including views of St. Mary's, Clumber; Queen's College Chapel, Cambridge; New Buildings, King's College, Cambridge; St. Paul's, Knightsbridge; St. Aldhelm's, Bransome, Bournemouth; St. John the Divine, Kennington; St. Matthew's, Westminster; St. Barnabas, Pimlico; Cowley Mission Church; Eton Mission Hall, Hackney Wick; Holy Innocents, South Norwood; St. Saviour's, Cardiff; and St. Mary's, Primrose Hill.

THE WORK OF MESSRS. BODLEY & GARNER.

WE have already referred to the article by Mr. E. P. Warren on "The Work of Messrs. G. F. Bodley & T. Garner," which appeared lately with an abundance of illustrations in the *Architectural Review*, which is published in Boston. The acceptance of the Institute medal by Mr. Bodley gives us an occasion to draw upon so excellent a record of the work of two English artists who have been more closely united than is usual in business partnerships. Mr. Warren says that between them "there never was a deed of partnership or any legal form. Nothing could have been less commercial in character than the partnership which bore this conjunction of names, for it would be impossible to find two artists more absolutely divested of commercial habit or instinct than George Frederick Bodley or Thomas Garner."

Both, adds Mr. Warren, were pupils of Sir Gilbert Scott, and launched on the topmost tide of the "Gothic Revival." Mr. Bodley, indeed, was Sir Gilbert's first pupil, and served an old-fashioned five years' apprenticeship, lodging in his master's house. Mr. Garner came later to the same school, and it was not until some few years after the completion of his pupilage that he joined his future partner, in the first place as an assistant.

Drilled, during his long apprenticeship to Sir Gilbert Scott, in a somewhat rigid convention of English Gothic—revived, but not revivified—Mr. Bodley not unnaturally began his independent active career with a revolt. His talents had the good fortune to meet with early recognition; and within a short time after the expiry of his pupilage he found himself with a new church upon his hands—that of St. Michael's at Brighton. Tired of the formalised versions of English thirteenth and fourteenth-century styles, with the stereotyped and elaborate mouldings and carvings which characterised the school in which he had been trained, he designed this church in an extreme severity of form and detail, and with a character suggesting the early French rather than the early English type. This building, now ruthlessly spoiled by the addition of a huge incongruous nave and aisle, by another hand, shows an original and most refined adaptation of a cognate style. Mr. Bodley struck with this, his first church, a note which is never absent from any of his subsequent work, that of suave dignity.

If Mr. Bodley's early taste in Gothic architecture inclined towards French types, that of his future partner was pronouncedly English. But for some time before his conjunction with Mr. Garner, Mr. Bodley's handling of Gothic architecture had undergone considerable change. He had become imbued with a keen perception of the beauty of English fourteenth-century, or "Decorated" work, and towards the middle of the "sixties" his designs began to show increasing evidence of that appreciation. The early French phase had passed. Austere simplicity gave way to a more suave severity, and an increasing use of softly-curved mouldings, engaged shafts and curvilinear tracery gradually testified to the conversion. The church of St. Salvador at Dundee seems to mark a middle point in this conversion. It is austere is form, but with a tempered austerity. There is a fine and graceful severity about its sharply-pointed arches of the nave arcade dying on to the capless piers, and the accentuation of the bays by the slim wall-shafts that run up to carry the roof principals. A gorgeous reredos, a gilded iron screen and diapered wall-painting, all added in later years, have done much to enrich the effect of the interior.

For the last thirty years Mr. Bodley's Gothic has always been, in so far as constructive detail is concerned, in the "Decorated" manner; but that manner has been so intensely perceived and assimilated as to become a natural, almost intuitive expression. His strong individuality shines through his adoptive fourteenth century as Wren's shone through his adoptive Palladian style.

It was doubtless kindred sympathies, kindred appreciations and kindred studies that drew together the partners, who for little short of thirty years were associated in strenuous endeavours to redeem the unhappily degraded art of architecture, and whose influence and example have had so marked an effect upon the work of their contemporaries.

Their co-operation began without actual partnership upon the church of All Saints, which stands opposite the great Gate of Jesus College at Cambridge, and whose shapely spire is well known to all frequenters of that city.

A formal partnership was entered into in 1869, and amongst other work which it immediately shared was the church, initiated by Mr. Bodley, of St. John at Tue Brook, Liverpool, a church of distinctly English fourteenth-century character, not elaborate in structural detail, but very elaborately furnished and decorated. The general effect of the interior is ornate and somewhat dim and mysterious; it is in many ways extremely characteristic of the views and tastes which stamp indelibly the united work of the next twenty years. It has the distinction, the effect of spaciousness and lofty aspiration which these gentlemen have almost invariably contrived to impart, even within narrow limits, to their ecclesiastical work. It has intensely the sense of style, less archæological than personal. It exhibits a deliberate departure from the conventional method of contemporary "Gothicists," in the "later" manner adopted for the screen, organ-case and other furniture, which suggests the fifteenth rather than the fourteenth century.

The Tue Brook Church was soon followed and eclipsed by two others, which still remain pre-eminent in character and prestige amongst the many subsequently designed by the same architects. These are the churches of the Holy Angels at Hoar Cross, Staffordshire, and St. Augustine at Pendlebury, near Manchester. They are nearly contemporary, the former begun in 1871, the latter in 1873. Though stamped with the impress of a kindred inspiration, both expressing the same lofty idealisation, and both marked by extreme refinement in detail, these buildings are as different in form and character as the exigencies of site, requirements and materials can make them.

The church is a thoroughly modern building, of frankly expressed construction, and if it were the sole instance of the united efforts of its authors, would still be sufficient to give them high rank amongst their brother artists. Flanking the southern side of the churchyard, and slightly eastward of the church, stands the school building, a large low range of red brick, quiet, simple and proportionate.

The School Board offices on the Thames Embankment, begun in 1873, was intended as a portion only of a final scheme. It has been, since, most unfortunately completed by other architects. It is distinctly French in feeling, and that character, probably suggested by its environment, falls in, not unpleasantly, with the somewhat continental impression of the tree-lined highway that it faces.

It is built of brick, shown only in sparingly striped courses, with intermingled ashlar bands on the front, and the imposing chimney-stacks. The whole façade, in spite of its horizontal entablatures that mark the storeys, presents a strong effect of vertical tendency. The slender pilasters and engaged columns, the tall mullioned windows and their leaded panes, all add to this effect. It was pleasant in colour a score of years ago in its pristine newness; it is pleasanter still to-day when London has overlaid its Portland stone and bright red brick with her softening veneer of grime. Its high-pitched roof and tall pedimented and buttressed dormers complete the sense of graceful lift which gives it an extreme distinction amidst its ill-considered neighbours. Within it is adroitly planned upon its narrow site, and contains a handsome board-room and a number of committee-rooms and offices—quiet, distinguished-looking rooms, many of them provided with high, imposing chimney-pieces. In this instance I believe I am safe in saying that for the planning of the structure and the design of the river front Mr. Garner is mainly responsible, while Mr. Bodley devoted himself more especially to the decorative finish of the interior.

A couple of miles further west, and still upon the embanked river shore, is another building, this time purely domestic, by the same architects. River House stands on the Chelsea Embankment at the corner of Tite Street. It was completed in 1879, and is, though barely aspiring to the title of a mansion, a dignified and admirably proportioned dwelling-house of sufficiently imposing dimensions. It is faced externally with buff-coloured stock bricks, while its window quoins, cornices, pediments and string-courses are of gauged red brick. It is a staid and careful composition in the earliest eighteenth-century manner, a close and studied adaptation of the style of Queen Anne. Again, as in so much of their civil work, the design of the structure is chiefly due to the junior partner, while in the interior, with its fine sobriety of scholarly detail and quiet

rmonies of decorative treatment, it is hard to say where r. Garner ended and Mr. Bodley began.

But no indication of their mutual work would be complete thout some notice of the collegiate work at Oxford and mbridge, which has so greatly added to the high reputation hieved elsewhere.

In both cities they have done much. In Oxford, to give the ual precedence to the older University, they made their ginning, and their mark, at Christ Church College with their dition to the library, and the great tower that stands at the uth-eastern corner of the principal quadrangle, known as m Quad, and rises over the well-known and splendid old ircase leading to the hall, and which, with its slender central aft and fan-traceried vaulting, is one of the prime archi-ctural glories of Oxford.

This work at Christ Church was closely followed, and deed overtaken, by another addition to another college, and e "Master's Lodge" at University College was built between e years 1876 and 1879, and is the dignified dwelling of the ad of that Society. It is, as an Oxford house should be, of ne, and is another and a striking instance of the talent for corporation with old buildings, for the acceptance and similation of a dominant note, that characterises Messrs. dley & Garner. It is full of quaint dignity in the Elizabethan nner of the college—a manner in which Mr. Garner is culiarly happy.

The scaffolding had barely been removed from the Master's dge when the foundations for a newer and larger building, s time at Magdalen College, were begun in the year 1880. is, though now forming a conspicuous portion of the college, an entirely new and distinct building. It is known as St. ithin's Quadrangle, and was entrusted to Messrs. Bodley & rner.

The late fifteenth-century manner of the college has been nkly accepted, and Mr. Garner's studiously careful detail ows a close assimilation to the character of the adjacent ildings of St. John's Quadrangle, of which, indeed, some ht years later, he completed the northern side by the wing own as the President's Lodgings, and forming the complete d dignified dwelling of the head of the college. This house ntirely of Mr. Garner's design, and, with its thick walls, ep window embrasure, imposing stone chimney-piece and c panelling, has to an extraordinary degree the effect and ling of an old building; an impression which is heightened by t reinstation of a charming eighteenth-century staircase, some winscotting of a similar period, and by the magnificent arras estries and beautiful heraldic glass belonging to the college.

If at Oxford Mr. Garner has borne the lion's share of the rk accredited to the partnership, Mr. Bodley has redressed balance at Cambridge, and at Oxford is responsible for a e non-collegiate building in the church of St. John the angelist, in the suburb of Cowley.

At Cambridge Mr. Bodley has added new and distinct ldings to two colleges, King's and Queen's; at the former h has placed on the river-front, facing the "Backs," the mplete quadrangle known as Bodley's Buildings. At een's College Mr. Bodley is responsible for the new red-ck chapel, a tall, somewhat severe building of an un-tentious character, the asceticism of whose lofty interior is tapered by the rich colouring of the vaulted ceiling and the arpiece, and by the glow of Kempe's glass, which fills many the windows. Mr. Garner made his individual contribution t the embellishment of Cambridge in the very handsome can-screen of Christ's College, and the partners were con-jntly responsible for other work in various colleges.

Between the years 1870 and 1880 they produced many signs beside those already alluded to, and amongst them se of two cathedrals: one the unsuccessful competitive sign for Truro, and the other that for the cathedral church of bart Town, Tasmania, which has been carried out, and is a ridly English design in the typical manner of its authors. lso saw the beginning of the church of St. Michael, Camden wn, London, mainly attributable, I think, to Mr. Garner. e period between 1880 and 1885 was a busy one for the tners, and one of the most striking and successful of their tual achievements, the church of St. Germain, at Cardiff, in uth Wales, belongs to it. This was a work of close collabora-n, and is marked by such an apparent singleness of intention d unity of handling, that only the most perfectly initiated servers could allot to either partner his individual share in design. There is a breadth of treatment, a spaciousness, intrinsic grace about St. Germain's Church which places it y high amongst the many beautiful creations of this order ich we owe to Messrs. Bodley & Garner. Its building was sely followed by that of another church in Cardiff, that of Saviour's, designed by Mr. Bodley—in a manner of extreme ntrast. It is very long and low, and the effect of its length increased by the inward inclination on plan of the chancel lls. It is full of character and has a dignity of its own, but kes no attempt to vie in scale or impressiveness with its tely sister.

A charming country-house at Godden Green, in Kent designed by Mr. Garner, belongs also to the early eighties, and to Mr. Garner was chiefly due the new chapel of Marlborough College, completed a year or two later, and richly decorated by his partner.

1886 brought Mr. Bodley an opportunity in many ways similar to that offered by Hoar Cross. This was the new church designed by him for the Duke of Newcastle at Clumber, near Worksop.

Clumber Church indicates a point of departure, a cessation of the real collaboration of the partners. For several years before the actual severance of the tie it had become practically nominal, and though intimately friendly and sympathetic, had ceased to have its former significance of close consultation, of interdependence and of mutual contribution to a mutual result.

For the sake of clearness it is, therefore, better to deal henceforward with their work as that of independent artists, influenced, indeed, as such intelligence must inevitably be, by a long course of associated labours, but performing each his individual task in virtual separation.

I take Clumber Church as marking the beginning of this period, though one or two previous designs which bore the names of both partners were perhaps just as absolutely the work of one of them. The great marble reredos in St. Paul's Cathedral, which is so well known as to need no description, was, for instance, absolutely Mr. Garner's.

The competitive design for Liverpool Cathedral, a competition in which no award was ever made, was also Mr. Garner's in actual conception and elaboration.

Mr. Garner during the same period was responsible for several buildings, ecclesiastical and secular, for the country churches of Bedworth, Peasdown and Camerton, for additions to Bosworth Hall, for Mr. Sidney's delightful house at Hampstead, and above and beyond all for what may be regarded as his *magnum opus*, the splendid mansion for Lord Windsor, known as Hewell Grange, in Worcestershire.

No notice of the work of Messrs. Bodley & Garner could be complete without mention of the numerous monuments to the dead which they have designed. Of these perhaps the most striking is the series of monuments erected in the several cathedrals to the memory of the Archbishop of York, and the Bishops of Lincoln, Ely, Chichester and Winchester; the first Mr. Bodley's design, the remaining four Mr. Garner's.

These monuments, placed as they are in ancient churches, have the merit of fitness and accordance; they are designed in a spirit of reverence, not only for the dead they directly commemorate, but also for the handiwork of the long-dead artists who wrought their stately surroundings.

Mr. Bodley and Mr. Garner, in the innumerable opportunities that have fallen to their lot, conjointly and separately, of repairing and adorning ancient buildings, have ever shown the most careful and tender solicitude for the preservation and expression of their intrinsic beauty and historic significance, as for the picturesque accretions of time, accident and naïve traditional craftsmanship. As single instances of their methods in this regard I have chosen two views of interiors—that of the old village church of Hickleton, near Doncaster, repaired and adorned by Mr. Bodley, and that of his own drawing-room, at Fritwell Manor in Oxfordshire, redeemed from a sorry state of dilapidation, receiled, repanelled and rehabilitated by Mr. Garner.

In their treatment of new buildings, as in their handling of old, Messrs. Bodley & Garner have ever maintained an uncompromising standard of excellence. They have unceasingly and ungrudgingly bestowed the most infinite pains upon even the minutest details of their work.

In their methods they have been a law unto themselves, bowing to no convention but their own. They have attached to them a circle, outside of which they seldom stray, of builders and approved workmen of various crafts, who by constant association and repeated realisation of their patrons' designs, have grown to a thorough understanding of their ways. Both possessed of charming country houses, it is their habit to do much of their designing in the peace and solitude of their own homes. Ignoring all precepts of professional advancement, moved by a mutual shrinking from publicity, they have held their independent course in quiet and unassuming self-confidence.

MESSRS. FOSTER sold on Wednesday, at 54 Pall Mall, a portrait of Lady Hamilton as Bacchante, by Sir Joshua Reynolds, an exceptionally fine example of the master. This is the picture which J. R. Smith engraved and published in September 1784, under the simple title of "A Bacchante," but the engraving differs somewhat from the picture itself, of which the canvas measures 30 inches by 25 inches. The bidding started at 1,000 guineas, and at 4,300 guineas it became the property of Mr. C. Davis, Bond Street. An illustration of the picture has appeared in *The Architect*.

NOTES AND COMMENTS.

THE inhabitants of Scranton, in the United States, deserve mention, for more liberal patrons of superintendents of municipal works could not easily be discovered. For example, a culvert which cost 772 dollars to construct required overseeing to the extent of 122 dollars, or nearly a sixth more. Inspection commonly costs 11 per cent., and is never lower than 4 per cent. If the work were satisfactory there might be little grumbling, but the city engineer says all his care in preparing specifications is of no avail, for with such a system of superintendence there is no use in demanding the best materials and workmanship. The paving, according to the engineer, has excited very general enmity and indignation among the public on account of the disgraceful and dangerous condition of the streets in the central city, and he adds, "There is hardly a man living in this city, should these conditions prevail in the immediate vicinity of his own home, but would, on the approach of a stranger, lock the door and hide himself out of shame." He recommends the appointment of a pair of inspectors at 60 dollars a month each, to supplant the horde of inefficient loafers who now have charge of works, and in ordinary business that course would be adopted; but in America appointments of the kind are rewards for political influence and activity. Easy work and liberal pay are therefore required.

WE suppose it is unavoidable for archæologists to escape wasting their emotions over shams. Their inability to distinguish counterfeits from realities has afforded subjects to satirists in all ages. A case has occurred in Sussex which resembles many which preceded it in that county and elsewhere. The name of WILLIAM DE WARRENNE recalls the days of Norman supremacy. He was a stout warrior who ruled in Sussex, and his wife GUNDRADA may have had the virtues and accomplishments with which the old romance writers endowed all ladies in her position. But they died just like the peasants and were buried in Southover Church. If their dust has mixed with that of meaner mortals their cists at least are supposed to have survived, and have been on view in the church. The leaden cases received due reverence from lovers of antiquity. But the appalling announcement was made a few days ago that the cists only date as it were from yesterday. They were cast in 1848. A plumber in Lewes says:—"My brother, WILLIAM DAVEY, cast two leaden cists like the old ones, and the bones of WILLIAM and GUNDRADA were placed into them and not into the old ones again. These new cases were placed in a square vault in the floor in the middle of the chapel, and a plate glass was put over them. The old coffins were left on the floor for exhibition. I was eight years old at the time, and I have never been in the church since." To confirm the statement an excerpt is supplied from the plumber's ledger, from which it appears an account was opened for "the late GULIELMUS DE WARRENNE," and on February 12, 1846, the following entry appears:—"To use of packing-case and time packing the lids of your own and wife's lead cists to send to the Archæological Institute, 4*s.* 6*d.*" On June 24, 1848, the Norman is further charged with 8*l.* 8*s.* for "two lead cists, &c." Whether he returned to Sussex to pay his debts does not appear, but the warriors of his time were rather indifferent about the settlement of accounts. The question which has more interest is whether the Southover cists are ancient or are simply the copies made by WILLIAM DAVEY in 1848? On that subject archæologists are divided, and are not likely to come to an agreement in a short time.

A CONGRESS of French architects has just been concluded at Tours, under the presidency of M. DUCHÂTELET. About eighty representatives of the profession were present. One of the advantages of Tours as a centre was the number of interesting places which could be visited. Among them were Langeais, Ussé, l'Islette, Azay-le-Rideau, Loches, Poitiers and Angoulême. Among the subjects considered was the development of the industries of art in the provinces, and how far they could be promoted by an extension of the system of teaching in the schools of art, and more particularly by the influence of architects. The latter was, of course, considered to be the most potent factor, although the officials held a different opinion. Last year the French Legislature passed a measure resembling the English Workmen's Compensation Act. As it is no less obscure in its clauses, there is apprehension that the onerous responsibilities of French architects may be increased by the application of some of the clauses to them. The congress declared that, as they were artists, all architects should be excluded from direct or indirect liability for damages. But inasmuch as the Code treats architects and contractors with equal rigour, the judges may be disposed to interpret the new law in a similar spirit.

IN spite of unceasing efforts, the supplementary attraction which is to resemble the Eiffel Tower in novelty, and to secure success for the Paris Exhibition of 1900, has yet to be discovered. Novelties have been suggested, but their value is indicated by the indifference of financial speculators to them. Under the circumstances, the project of a representation of Pompeii, as it appeared before the destruction in A.D. 79, is now receiving more attention than when first announced. Several artists and archæologists have expressed approval of the attempt, and the Italian Minister of Fine Arts has promised to give all his aid to insure accuracy. There would be some appropriateness in having such a restoration in Paris, for it was during MURAT'S reign of seven years that the systematic excavation of Pompeii was attempted. In the prior excavations portable objects alone were sought, and the buildings were sacrificed or neglected. The forums, temples, theatres, quarters for gladiators would allow of the introduction of groups and performances which would enable crowds to realise scenes in the everyday life of the Romans. A rival scheme is proposed in order to exhibit Pompeii as it is to the untravelled. But the time to produce a satisfactory restoration of the living or dead city is very limited, and apparently the exhibition will have to depend for attraction on works which exemplify modern art and industry.

ILLUSTRATIONS.

CATHEDRAL SERIES.—ROCHESTER: LOOKING SOUTH-WEST.—THE NAVE ARCHES.—THE TRIFORIUM.—EAST END OF CHOIR.—THE WESTERN TURRETS.

WHEN we began the series of illustrations of Rochester Cathedral we expressed regret that CHARLES DICKENS'S anticipations of being able to have his name bound up, as it were, with the old building was never fully realised. The brass which was erected after his death on the wall of the south-west transept records the aim of his representatives to carry out his wish, for it bears the following words:—"To connect his memory with the scenes in which his earliest and his latest years were passed, and with the associations of Rochester Cathedral and its neighbourhood, which extended over all his life, this Tablet, with the sanction of the Dean and Chapter, is placed by his Executors." There is also a melancholy interest in knowing that the last effort of his imagination was to create a vision of the cathedral as it appeared on such a day in June as he was then enjoying. His memorable words were:—"A brilliant morning shines on the old city. Its antiquities and ruins are surprisingly beautiful, with a lusty ivy gleaming in the sun, and the rich trees waving in balmy air. Changes of glorious light from moving boughs, songs of birds, scents from gardens, woods and fields—or rather, from the one great garden of the whole cultivated island in its yielding time—penetrate into the cathedral, subdue its earthy odour, and preach the Resurrection and the Life. The cold stone tombs of centuries ago grow warm, and flecks of brightness dart into the sternest marble corners of the building, fluttering there like wings." DICKENS'S admirers must always be glad that such a scene was before his mental vision a few hours before the singular expression of trouble and pain appeared on his face and his thoughts and words ceased to be coherent. As we close the Rochester series, we feel bound to recall the picture which the cathedral formed for the most popular of English writers, and which humbler people can also enjoy if they desire.

SUMMER HOLIDAYS AMONG FRENCH CATHEDRALS.

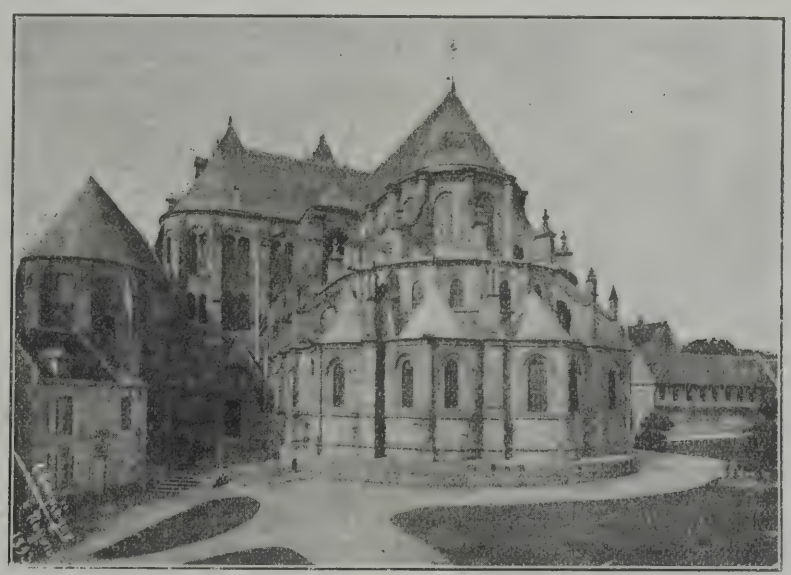
BY THE AUTHOR OF "ECCLESIOLOGIA GERMANICA," &C.

(*Continued from page* 402.)

XXV.

Noyon.

FOR a considerable time after leaving Senlis, the solitary spire of Notre-Dame remained visible across a treeless plain. Then it was lost, the train stopping at a succession of villages, some of them with high-sounding names, and churches having crocketed spires of the Creil type together with lofty chancels like those met with in the vicinage of that convenient *point de départ.*



To those with a superabundance of leisure, or intent on prosecuting stricter researches into the ecclesiology of the district, not a few of these churches would doubtless prove highly interesting and instructive.

At Crepy-en-Valois, which had a temptingly architectural look, carriages had to be changed, and shortly after the train passed, among others, the village of Jaux, whose small three-gabled church of red brick with an Early Pointed spire and rendering a post-prandial saunter round the city, upon its cessation, highly agreeable.

Although not so diversified as those of Senlis, the streets of Noyon are very old-world and enchanting. There is a fine market-place dominated by the steeples of Notre-Dame; shady boulevards screen the old part of the city from the modern one that has grown up around the railway station; and the streets, although ordinarily wearing an appearance of drowsiness, show no symptoms of decay. Everything in Noyon has a substantial, prosperous look, and through the *porte cochère* of many an eighteenth-century house with its louvred and red-tiled roofs, where strut colonies of pigeons, glimpses may be caught of really well-kept gardens bright with vivid masses of scarlet geranium.

One thing only Noyon lacks, and that is a grandly-performed daily office in its quondam cathedral of Notre-Dame,* one of the most beautiful and complete monuments of the Transitional period in France or elsewhere.

Viewed from the east its most striking feature is the apsidal termination to either transept, which, together with the employment of projected steeples at the angles formed by the eastern and transeptal limbs, may be attributed either to the long connection of Noyon with the see of Tournay or to its proximity to the German border.

NOYON: APSE AND SOUTH TRANSEPT OF NOTRE DAME.

Flamboyant traceried windows, had a very captivating appearance. I regretted afterwards that I did not break the journey at Crepy, for at Compiègne, where I allowed myself a couple of hours, I was disappointed in the two churches of St. Jacques and St. Antoine. The former, a large Early Pointed structure, has had its interior almost completely masked in a remorseless rococo fashion; the latter, a jejune Flamboyant edifice, enshrines a black marble font, similar in motif to those in Winchester Cathedral, St. Michael's, Southampton, and East Meon, but wanting the angle shafts.

Another short railway ride, during the progress of which I noted several churches with saddleback towers on either side of the line, and presently the two noble western steeples of Noyon came in sight.

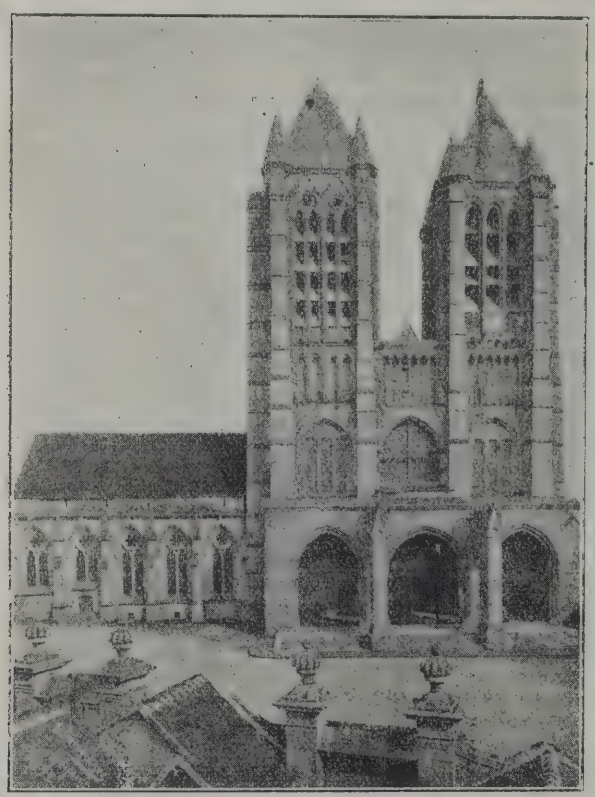
An omnibus met the train and rattled me over the stony streets of the little city, depositing me in good time for dinner at the doors of the Hôtel du Nord, which combines the advantages of an excellent cuisine and an uninterrupted view of the choir and transepts of France's most delightful Early Pointed cathedral—one which it is a duty to see and a pleasure and privilege to have studied.

The summer during which the tour I am now describing was taken was one of unusual brilliancy and splendour, but a very heavy thunder-storm which broke over Noyon whilst sitting at dinner, when the western steeples stood out like two great white cliffs against a sky of inky blackness, thereby producing a very fine effect, was by no means unwelcome, for it lowered the temperature without breaking up the fine weather, besides

The illustrations which I have given of this most charming parallel triapsal cathedral's exterior preclude me from entering into a detailed description, but in the view of it from the east I would draw attention to the position of the doorway, which, as in some Rhenish churches, occurs in the eastern side of either transept;† to the curious fenestration of the clerestory in the same portion of the building, and to the double tiers of windows necessitated by the extraordinarily grandiose triforium, another feature borrowed from Tournay, and of which I shall speak presently when describing the interior of this most fascinating church, whose austere western façade fitly prepares the mind for the chastened grandeur of the interior. Few great French churches of the Early Gothic period can show an exterioral ensemble so little disturbed by the accretions of later ages.

The divergency in the detail of the gracefully elongated belfry stages will be noticed, also the noble range of Geometrically traceried windows lighting the Salle de Chapitre to the north, while the exquisite carving in foliage above and below the now shaftless and figureless jambs of the triple western doorways, sheltered by the simple porch extending the length of the façade, deserves the closest attention from the student of thirteenth-century detail.

Entering Noyon Cathedral from the west—though perhaps



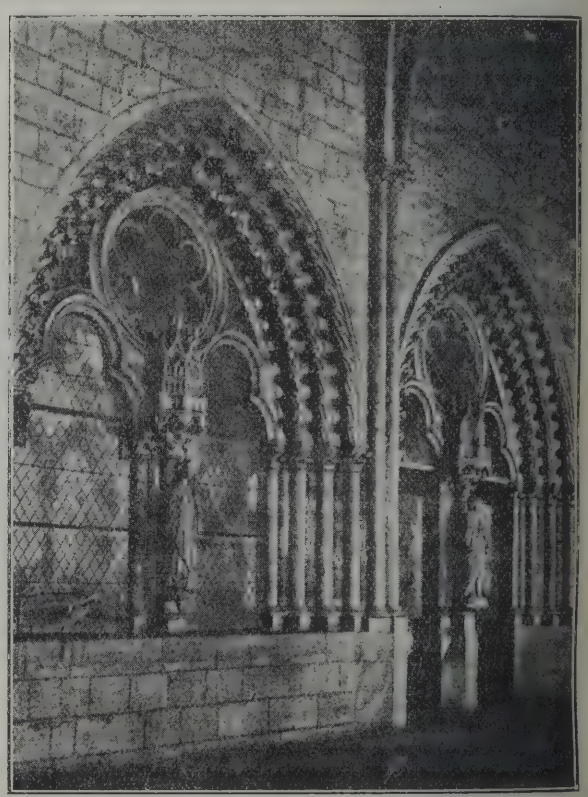
* The see of Noyon was suppressed in 1801, and, with that of Senlis, placed under the jurisdiction of the Bishop of Beauvais.

† S. Maria in Capitolio and the Apostles Church at Cologne exemplify this. We meet with it also at Mayence and in the eastern pair of towers at Bamberg.

the most impressive *coup d'œil* of its interior is to be had from the threshold of either of the transeptal portals—you are not overwhelmed as at Amiens, or Beauvais, or Bourges, or Chartres, but you instinctively feel yourself to be in the presence of a most charming and reposeful church—one that grows upon the mind and imparts renewed pleasure at successive visits.

Immediately you set foot in the nave a striking feature presents itself in the tall Pointed arch which opens on either hand into the space formed beneath the towers, and which, together with that spanning the church transversely, constitutes, as at Peterborough, a species of gigantic internal narthex or space distinct from the nave proper. This has ten bays of Pointed arches broken up into couples of five by the vaulting shafts, each pair springing from a cylindrical shaft, with almost classically foliaged capitals, similar to, but not so refined as those at Senlis.

A series of Pointed arcades opens above the pier arches into the tribunes. These spacious vaulted galleries, lighted in this instance by Romanesque windows in pairs, are peculiar to several great churches of this part of Europe, and, corresponding to the grandly developed Anglo-Norman triforia of Norwich, Ely and Peterborough, afforded accommodation for the spectators of processions and of those miracle plays which in Mediæval times were so frequently enacted in the naves of churches.



NOYON: WEST FRONT OF NOTRE DAME.

Surmounting these is a low arcade of semicircular arches unpierced, and, above all, a tall clerestory of very simple round-headed windows in pairs, similar to those lighting the tribunes. Such a quadruple division in height constitutes another feature borrowed, doubtless, from Noyon's prototype, Tournay. Here it is productive of a very grand effect, and perhaps nowhere in France is the struggle that was going on at the period of the church's erection (1150-70) between the round and pointed arch, resulting long before the close of the century in the triumph of the latter,* so finely illustrated.

Laon Cathedral furnishes us with another noble instance of this quadruple division of the elevation. There it is entirely Pointed. Tournay, the Romanesque example, is very majestic, but suffers somewhat from the two lower ranges being of almost equal dimensions, while its uppermost storey, together with the roof, is poor sham Romanesque of the last century. Taken together, however, Tournay, Noyon and Laon afford three most interesting comparative studies.

In the first three bays of the eastern limb we find both the quadruple division of elevation and the admixture of the round and pointed arch; but in the apse, where the too frequent filleting of the vaulting shafts hardly constitutes an agreeable feature, the latter reigns supreme; albeit the Romanesque element peeps out in the circular plan of the shallow chapels radiating from its processional aisle. Throughout the choir's clerestory the simple lancet is employed with beautiful sublimity of effect, and in the three central ones of the apse a beginning of good modern stained-glass has been made.

From the nave aisles there is a slight ascent of steps into the transepts, which have not the circumambient aisle possessed by the similarly-planned ones of Soissons and Tournay. Here again we find the quadruple division in the elevation, the low blind arcade occurring below the division corresponding to the tribunes in nave and choir. The walls in the lower part are relieved by tall Early Pointed arcades, some of the divisions having been scooped out to form Grecianised niches. The door leading into either transept has been likewise Grecianised, but not obtrusively. Above the southern one I read the following inscription from St. Cyprian:—

NOYON: ENTRANCE TO CHAPTER-HOUSE.

Ecclesia istic non clauditur,
Nec episcopus alicui denegatur.

This is one of the great French churches preserving the basilican arrangement, the high altar, a really imposing affair albeit Grecian, standing just under the eastern arch of the great crossing. In front of it, and extending the whole width of the transept, is the ritual choir, separated from the nave by a tall plain iron gate and side screens. The stalls for those engaged in the musical part of the offices find room in the spacious *arrière chœur* behind the high altar.

Returning into the nave, we pass into its south aisle to find the original Doric simplicity of the twelfth-century church disturbed by a series of those Middle-Pointed accretions in the form of chapels from which few great French churches of its age are free. However, at Noyon the work exhibited by not a few of these chapels is good, and their picturesque ensemble somewhat compensates us for the loss of the original aisle fenestration.*

Having paused to admire the magnificent cross views of the

* An interesting article on the chronology of Notre-Dame at Noyon appeared in *The Architect*, November 25, 1898.

* At Sens Cathedral during M. Viollet-le-Duc's restoration the Middle Pointed chapels were removed, and modern Transition work substituted for them.

church to be had from various points in the south aisle, we may proceed to inspect sundry of these chapels, each of which is co-extensive with the coupled arcades of the nave. The first, counting from the west, disused at the time of my visit, is good Late Decorated, with tracery in its two windows, which in point of delicacy nearly approaches our own of the same epoch. The second chapel is inferior Decorated, its late character being indicated by great pendant bosses and by the tracery of its three windows, of which the centre one is equipped with a Radix Jesse in modern stained-glass, apparently copied from an ancient example, but in which one desiderates white to relieve the enormous quantity of positive colour. However, the poverty of this chapel's structure is in some degree compensated for by a most elaborate reredos which, like those in certain Oxford college chapels, occupies the whole of the eastern wall space. A wooden screen filled in with iron, simply cross framed, and fencing this chapel from the aisle, is interesting.

The northern range of nave chapels do not present any features of much interest beyond their detail, which is earlier and better than that of the opposite series. The windows, which are all Geometrically traceried and filled with indifferent modern stained-glass, "give" on to the remains of a very graceful little cloister, where a pêle-mêle of fruit trees, wild and silver beeches, sombre firs, vines and creepers springing from a carpet of rank grass, only too plainly bespeaks the word "Ichabod." But no visitor to Noyon should omit to visit this half-deserted, half-cared-for looking spot, not only for the sake of the magnificent ensemble presented by the northern elevation of the nave and steeple, with its hipped gabled roof and gracefully elongated belfry stage, but to study one of the loveliest pieces of Early French Gothic of its kind in existence—the entrance to the chapter-house in the western walk of the cloisters, and of which I append an illustration. Several times did I repair thither, so fascinated was I by the combination of nature and art, which, lovely as they appeared at the time of my visit, must be doubly so in autumn. In fact, I was charmed with the whole place, both from an ecclesiastical and secular point of view. To those in search of "fair quiet and sweet rest," combined with study of one of France's noblest Early Gothic temples, my advice is, go to Noyon.

SOCIETY OF ARCHITECTS.

AT the meeting of the Society of Architects this week in Sheffield, which was one of a series to be held in order to obtain the views of provincial architects, the following paper was read:—

The Statutory Registration of the Profession.

By ELLIS MARSLAND.

I do not propose to occupy your time at any great length this evening, but desire to point out as briefly as possible the main features of the movement we are now met to discuss.

Although the question of the statutory registration of the profession has for many years occupied the minds of architects, it was not till the year 1886 that any very definite organisation was determined. In that year, on April 6, a Conference of Architects was called at the Freemasons' Tavern, London, and its views were expressed in the following resolutions:—

"That, in the interests of the architectural profession and of the public alike, it is desirable that all architects in the kingdom should be united in one body, having branches in the provincial cities and towns and a central council in London, including amongst its members representatives from the provinces.

"That a committee be formed without delay to give effect to the foregoing resolution, and to facilitate the formation of committees in the provinces.

"That it is the opinion of this meeting that instructions should be given to the committee to consider the means necessary in order to obtain an Act of Parliament making it compulsory for all architects to hold a Government diploma."

A committee was then formed called the Architects' Registration Committee, to give effect to these resolutions, and after careful consideration came to the conclusion that in the last of the three lay the essence of the whole. Accordingly they issued a circular to some 2,500 architects in practice in the United Kingdom, with a request that they should sign, if they thought fit, the following declaration:—

"Whereas we, the undersigned, are of opinion that it is for the benefit of the public and the architectural profession alike that legislative powers should be obtained, so that all persons hereafter entering the profession shall be duly qualified by examination, we are desirous that committees should be formed to promote the object in view and to obtain the necessary Act of Parliament."

Some 1,300 replies were received to this circular, of whom 165 were Institute members and 175 members of the Society of Architects.

After the receipt of these replies the committee set to work, with the result that a Bill was introduced into Parliament in 1887, which included architects, civil engineers and surveyors. This Bill excited the opposition of the two last-named bodies, and it was eventually decided that the Bill should deal only with architects, and a fresh Bill was introduced and was ordered by the House of Commons to be printed on March 7, 1893. This is the extent of progress that has been made up to the present.

Before any further progress can be made it will be necessary to show that there is something like unanimity among architects upon this question, and with the purpose of obtaining the views and opinions of provincial men, whom this question affects much more seriously than men in London, the Society which I have the honour to represent here to-night is organising a series of meetings in the chief provincial centres, that architects may be brought together; and should it be found, as a result of these meetings, that there is a great preponderance of opinion in favour of registration, we shall, having the knowledge of your support, be encouraged in our efforts to realise the object at which we aim.

We, of course, cannot expect to make much headway with any Bill until we have convinced the Institute that their present attitude is a false and mistaken one, and by these meetings we hope to show them that they are acting in opposition to a large section of their provincial brethren, and also contrary to the best interests of the progress of architecture in this country.

My Society has no wish to take the lead in this much-needed reform, and if the Institute will but take the matter up in earnest and see it through, they will have our hearty co-operation. Then, with a united front, we shall be able to show Parliament that we are resolved architecture shall in reality, and not as at present by courtesy, be recognised as one of the professions.

It may be asked what is meant by registration. It means, in the present, that every man practising architecture shall be duly enrolled in an official register under an Act of Parliament, and be duly responsible for his professional actions, and that no one be allowed to practise until he has been duly enrolled. In the future, it means that no one be allowed to practise architecture until he is duly qualified and has been found so by undergoing a qualifying examination.

At present there are only three recognised professions—the Church, Law and Medicine—to all of which it is considered an honour to belong, and why? Because to be a member of one of them implies the fact of having undergone a prolonged and complete course of study and preparation, which has fitted him for the position to which he has attained.

Why is architecture excluded? To possess the knowledge to build, and the skill to plan and design a building, and to deal with innumerable questions—scientific, artistic, legal and sanitary—which continually present themselves in ordinary practice, requires a training as arduous and as prolonged as that of any to which I have alluded. If the men who provide for our spiritual and physical welfare, and those who conduct us through the mazes and intricacies of the law, are to be honoured with the dignity of being called professional gentlemen, surely the men who provide the necessary skill to erect our churches and public buildings, and to make our homes healthy and artistic, are entitled to the same dignity.

But the answer is not far to seek. At present any person with or without a fair general education, any builder, builder's foreman, clerk of works, clerk in a local board office, auctioneer, undertaker, *et hoc genus omne*, with the sole qualification of being able to provide a brass plate, is at liberty to advertise himself as a person qualified to give advice to the public in the science and art of architecture. Builders and others going out of their proper province boldly proffer their services as architects to their customers gratis, and the tempting bait of an apparent saving of 5 per cent. is not to be resisted.

Can it be a matter for wonder that we are still unrecognised while such a condition of things exists? For at present the public have no guarantee that the class who call themselves architects are any better qualified to plan and design their buildings than the contractors who erect them, and should they employ an architect they have no means of ascertaining that his knowledge is greater than that of the builder, and the only certainty about it from their point of view is they will have to pay the professional charges.

Of what use is it for the Institute to say that their examination is a panacea for the existing evils unless this examination is made compulsory? Until men find that by undergoing a course of study and passing an examination they are placed in a better position in the eyes of the public than the man who possesses no qualifications at all, it is very unlikely that an appreciable number of men will voluntarily come forward and avail themselves of this means of entering the profession.

The necessity for a higher standard of professional excellence and public confidence is of essential importance to provincial men. There is a feeling, a mistaken one if you will, that local architects are all very well for the ordinary work of the town, but so soon as any work of primary importance is to be executed, architects from outside must be invited to compete. Does not this arise partly from a want of confidence, there being no guarantee in employing a man who is styled an architect that he really knows his business? But in nine cases out of ten it is the local man who, from his knowledge of the materials of the locality and the special requirements of his fellow townsmen, is more likely to carry out the work satisfactorily than an architect from a distance.

The advantages arising from registration are these—

Closing the doors to incompetent men.

Raising the standard of the profession.

Obtaining the confidence of the public and State recognition.

It is not proposed for one moment to say that all who desire to build should employ an architect, but what we do propose is that henceforth, in the interests of the public, no person shall be entitled to call himself an architect whose name is not enrolled as qualified under an Act of Parliament, and any person wishing to employ an architect may, by consulting the "Official Register," ascertain what men are qualified.

Objection has been urged against the movement that it will create a monopoly, and thus be opposed to the principles of modern legislation, but there cannot be a monopoly created where it is made possible for any one who proves himself qualified to share the rights.

Another objection is that it will be necessary at the outset to register some of the very men who have caused all the mischief. This is very true, and unless you do this you will find that Parliament will not listen to you. That you must respect vested interests is an axiom of parliamentary practice, and where a man can show that he has practised architecture, Parliament will say you must not derive him of his rights, and the obstinate attempt to exclude this principle from the Medical Act was the chief cause of delaying its passage through Parliament for thirty years.

The first effect of a Registration Act would be to put a stop to any further increase in the number of incompetent practitioners, and henceforth they would become a diminishing quantity.

The general outline of a Registration Act would consist of—

A preamble, shortly stating its objects.

A title, which might shortly be the "Architects' Act."

The provision of a general council and branch councils to administer the Act, composed of members of existing architectural bodies, as well as members nominated by the Privy Council and registered practitioners.

A provision as to the appointment of registrars and the necessary machinery for registration.

The qualification for registration at the commencement of the Act should include all members of existing architectural bodies and such other persons as could show, to the satisfaction of the council, that they were actually practising architecture; and afterwards only such persons as had been duly articled and had passed a qualifying examination.

The provision of an examination, either by the general council or some already existing architectural body.

And, lastly, fines upon unqualified or unregistered persons practising as architects, and a provision as to their inability to recover charges for professional services rendered.

A Bill prepared on the above lines has been drafted by the Registration Bill Committee, and I take this opportunity to correct an erroneous impression that is abroad that this Bill is the child of the Society of Architects. That it meets with the general approval of that body is no secret, but the Society is by no means pledged to it in all its details; it may be necessary to amend it in some particulars, and the object of this meeting is to elicit the opinion of architects on the general question, and not upon the details of any particular Bill. The time may come when with certain modifications the Society of Architects may adopt it, but not until the general sense of the architectural profession has been declared definitely in favour of the principle.

If architects want such a measure, this Society will leave no stone unturned to bring about its realisation. If, on the other hand, the general feeling is against any registration scheme, we shall be content to let the matter drop. Gentlemen, the matter is in your hands.

The Designs sent in for the diploma to be used in connection with the Paris Exhibition of 1900 have numbered 109. The authors of the five designs considered most worthy, and who will take part in the second competition, are MM. A. Besnard et Vaudoyer, Camille Boignard, Diogène U. N. Maillart, Michel Lançon, and Rosset-Granger. The first prize is 10,000 francs, and 1,000 francs will be paid for each of the four other designs.

ST. NICHOLAS, SEVENOAKS, AND KNOLE.*

AFTER leaving the station and passing through the town of Sevenoaks, attention was drawn to the interesting parish church dedicated to St. Nicholas, over which the rector, the Rev. T. S. Curteis, M.A., F.S.A., was good enough to conduct us; he has dwelt with so much interest on the points of attraction in this church that it leaves very little for me to tell you.

The nave is of the late thirteenth-century period of architecture, the north aisle of the Decorated period about 1320; the chancel, chancel aisles, south aisle, south porch and tower are all in the Perpendicular period. Over the south porch is the parvise, now used as a choir vestry. The aisles and the south porch are embattled; the latter is large and handsome with octagonal staircase turret.

The tower at the west end is 90 feet to the embattlements, resembling many others in the neighbourhood, and is three storeys in height. It contains a clock and eight bells. The west door is set in a square heading with panelled spandrels, and above is a good window of five lights; the belfry windows are square headed. There is a battlement and octagonal corner turret. The windows are mostly of three lights except those in the north aisle, which are of two; and those in the clerestory are of four, but not large.

The interior is handsome and in good preservation, the length being 150 feet. The nave has lofty Pointed arches on each side with octagonal piers, and the chancel has two with piers of clustered shafts.

The roof of the chancel is new, in the Perpendicular style. On the north side of the chancel is a vestry embattled. The sanctuary is well decorated and the altar well elevated, adorned by a handsome jewelled cross and candlesticks, and vested with rich silk frontals and embroidered. There are two handsome candelabras on the steps in front of the altar. The organ was built by John Avery in 1798. It was opened, as a window bill in existence records, "in a solemn and patriotic manner," and the offertory at the service was given to the widows and orphans of the gallant soldiers and sailors who fell in Lord Nelson's celebrated victories.

The windows are very beautiful, especially the east, and that in the tower is very fine, and was erected by public subscription to commemorate the Queen's Jubilee, 1887, at a cost of 700*l.* It represents Our Lord's Ascension.

A fine panoramic view of Sevenoaks and its surrounding country was obtained from the tower.

There are over forty different monuments and monumental slabs on the walls and floor. That to Earl Whitworth is surmounted by a bust by Chantry. The pulpit now in the church was made (according to an entry in the Wrotham Register) by the "Joyner of Sevenoke" in 1636, for 8*l.* 10*s.*, at the order of the churchwardens of Wrotham. A new pulpit was provided for the latter church, and the discarded old pulpit was bought for a trifling sum, cleansed from its many coats of paint and whitewash and restored to the church.

Knole.

I need hardly say any more about the church, but proceed to describe the noble seat of Lord Sackville, which stands in its fine park immediately contiguous to the town of Sevenoaks, the park gates being opposite Sevenoaks Church. The area of the park is nearly one thousand acres, about two miles long from north to south and one and a quarter mile from east to west, the park being delightfully undulated and beautifully timbered, and the view from the south, from the staging erected for the purpose, over the Weald of Kent, is probably unsurpassed.

In the reign of King John, Knole belonged to Baldwin de Bethun, Earl of Albemarle. It afterwards passed to the Mareschalls, Earls of Pembroke, and the Grandisons and the Sayes, and in the reign of Henry VI. to James Fiennes, or Fynes, created in 1446 Lord Saye and Sele, and so barbarously murdered by Jack Cade. His son, Sir William Fiennes, second Lord Saye, sold Knole, "with all its appurtenances," for 400 marks to Thomas Bouchier, Archbishop of Canterbury, in 1456.

Bouchier enclosed the park, rebuilt the house, made it his residence, and died in 1486. His successor, Cardinal Morton, also died here in 1500. It continued to be the seat of the Archbishops of Canterbury, one of their sixteen palaces, until Henry VIII., who had often visited Archbishop Warham here, and taken a liking to the place, forced Cranmer to an involuntary surrender of it.

The deed of indenture by which Cranmer surrendered Knole to the king was dated November 30, 1537. It remained in the Crown until July 1550, when Edward VI. granted it to John Dudley, Earl of Warwick, created Duke of Northumberland 1551, who, however, in 1553 changed the lordship and manor with the king for other estates, but reserved to himself the house and appurtenances. These by his attainder the same

---

* From a paper read by Mr. Cooper-Penn at the visit of the members of the Upper Norwood Athenæum.

year reverted to the Crown, and Queen Mary soon after granted the house and manor to Cardinal Pole, whom she had nominated Archbishop of Canterbury—the last archbishop who possessed Knole. The cardinal archbishop died a few hours after Queen Mary, and Knole was at once resumed by the Crown, though the grant was to Pole for his life and a year after, as he should by his will direct. Queen Elizabeth granted Knole in 1561 to Sir Robert Dudley, afterwards Earl of Dudley, but five years afterwards he resigned it to the Queen. It then passed to Thomas Sackville, afterwards Lord Buckhurst and Earl of Dorset, who came into possession about 1605, and who rebuilt and greatly extended the house. The third Earl sold Knole in 1612 to Alderman Smith, reserving, however, a lease of it to himself and heirs. It was held on this tenure by the Sackvilles till Richard, fifth Earl of Dorset, redeemed the lordship and estate in 1661. The estate still continued to them till the decease of the fourth Duke of Dorset, when it went to his sister Mary, who married the Earl of Plymouth; from her the house and lordships have passed in tail to the Hon. Mortimer Sackville-West, Baron Sackville of Knole, 1873 to 1888. The present possessor, Lionel Sackville Sackville-West, was born July 19, 1827, succeeded 1888, entered the diplomatic service 1847, became secretary of Embassy 1867, accredited Minister Plenipotentiary at Paris in absence of the ambassador, 1871; minister to the Argentine Republic 1872-78, to Madrid 1878-81, and to Washington 1881-88; K.C.M.G. 1885, G.C.M.G. 1888. The Hon. Wm. Edward Sackville-West, brother of the present Earl, born 1830, is the heir presumptive (under special remainder).

The principal front is unbroken except for the towers and central gate-house, dormers in the wings. A tall central gate-house has square, embattled flanking towers. The wings have each five stepped dormer gables. The gate-house is probably Bouchier's, 1456-86; the rest of the front has been ascribed to Archbishop Morton, 1486-1500. The second gateway on the south of the first court, the inner court, hall, chapel and lower storey of the buildings are said to be Bouchier's. A large portion may be assigned to his successors. A large part of the building was erected by the first Earl of Dorset, reign of James I., but parts are of the time of William III. and later.

In the Wood Court you may see specimens of all the styles of Domestic architecture which have prevailed in England for 400 years. Looking west with our faces towards the house we have on the extreme right the Gothic buildings of the archbishop's. At right angles stand the stables and the Tudor upper storey, which still bears the name of the king's stables. The portion of the house immediately facing us is composite in character, the lower part is early and the upper Elizabethan and later work. Further towards the south the Stuart period comes in distinctly; and then we have a window which was inserted probably after 1700. A fire in 1623 will account for other alterations. Another fire some thirty years afterwards has left its mark in some modern windows to the right. The south end of the Wood Court is occupied by the laundry, a Stuart building, and its lawn. The south-east has still a small apartment which retains its name of the Gaol, and may possibly have been used as a place of punishment for the archbishop's servants. It is of the archbishop's time. (Loftie, Knole House, Archæologia Cantiana, vol. lx. and comp. Thorne's Handbook.)

House.

The entrance to the rooms open to the public is by the central gate-house. This leads to the Green Court, at the opposite side of which is the second gateway. Observe the fine oriel, and Bouchier's cognisance, the Eagle and Bouchier Knot.

Passing through into the Stone Court see in front an Ionic portico or colonnade which opens to the hall, with which the tour of the public rooms commences.

The hall is of the Bouchier period, ceiling Lord Buckburst's adding. It is well preserved, and enables a fair notion to be formed of its appearance in the days of the first Sackvilles, when seventy to eighty persons sat daily at dinner in the hall, and my lord had a constant household of 119 persons independently of visitors (ex household book). On screens, walls and windows are bearings of the Sackvilles. One of the Jacobean long tables stands here, its top marked for the game of shuffle-board.

Among the pictures, notice Silenus and Bacchanals (Rubens); Boar Hunt (De Vos); George III. and Queen Charlotte (Ramsey); Lionel Cranfield, first Earl of Middlesex, with Treasurer's stick in left hand; John Lord Somers (Kneller); Lord Buckhurst and Lady Mary Sackville (Kneller); a large and curious procession to Dover Castle (Wotton). On the dais is a good life-sized antique marble statue called Demosthenes, and an inferior recumbent statue of the nymph Egeria.

Observe on ascending the principal staircase the curious monochrome decorations of the walls, the shield and arms in the windows, the leopards sejant on the rail standards, and the quaint carvings beneath.

From the staircase the Brown Gallery is entered, which is 88 feet long with floor and sides of oak; the room is low and dark. In the windows are the arms of England in a garter, the Tudor rose and the Prince of Wales's plume. It contains curious carved walnut furniture, the chair of King James I., inlaid tables, silver sconces of James I. and his queen, and quaint seats and stools with noticeable wrought silk and velvet coverings. There are numerous portraits, especially to be noticed, Oliver Cromwell by Walker, Thomas Sackville, first Earl of Dorset, by Holbein, and an excellent portrait of Margaret Roper, ascribed to Holbein. A masked ball given by Wolsey to Henry VIII. and Anne Boleyn.

Lady Betty Germain's chamber was next visited. It contains a curious old oak bedstead and furniture, heraldic glass and tapestry, &c. The dressing-room, which contains portraits of Anne, Countess of Dorset, Pembroke and Montgomery, and her first husband, Richard, third Earl of Dorset (Jansen), Thomas, first Earl of Dorset, Sir Walter Raleigh, in armour; Villiers, Duke of Buckingham, was next inspected.

The Spangled Bedroom, which was next seen, has in it furniture presented by James I. to Lionel Cranfield, Earl of Middlesex, an Indian cabinet, ebony cabinet, Venetian mirror, tapestry with Mercury and Argus, and other classical subjects, also the portraits of the Duke of Monmouth.

The Spangled Dressing-room has several pictures, particularly James Compton, fifth Earl of Northampton, ascribed to Vandyke, some miniatures and a good Venetian mirror.

The billiard-room contains a quaint old billiard-table, said to be 140 years old, with pockets not unlike the billiard-tables in use at the present time, far less substantial legs but more in number, and bent cues with ivory tips for the ladies. There was one large ball and two smaller ones on the table, so that it is evident there has been some changes since the game was played in the last century. There is a noble portrait by Vandyke of Sir Kenelm Digby, Sir Thomas More, Philip of Spain and his queen.

In Leicester Gallery, James I., his son Prince Henry, and Nicolo Molino, the Venetian ambassador, all by Mytens, &c. The elaborate and richly-illuminated pedigree of the Sackville, Clifford and Curzon families, prepared 1623 by Sir Wm. Segar and Richard and Henry St. George, Garter Morroy and Richmond Heralds, for Edward, fourth Earl of Dorset, were particularly noted, and the fine views from the windows very much enjoyed.

The Venetian Bedroom, so called from having been slept in by Nicolo Molino, the Venetian Ambassador, contains superb furniture, quaintly shaped and carved, and covered with green-cut velvet, with which it was originally fitted. The costly State bed was prepared for James II. The toilet table and mirror are of silver. The portrait of the Empress Catherine II. of Russia, in red military uniform, was given by her to Lord Wentworth. In the adjoining dressing-room some noteworthy seventeenth-century furniture and several portraits were inspected.

The organ-room received its name from an ancient organ being so placed that by opening a window it could assist the choir during the service in the chapel below. There is some fine early sixteenth-century furniture in this room.

The chapel is of Bouchier's time (1456-86), but has been much altered. Under it is a vaulted crypt. The carving in wood of the Crucifixion is said to have been given by Mary Queen of Scots to Robert, second Earl of Dorset, shortly before her execution. In the chapel gallery and chapel-room is more tapestry.

The ballroom has finely carved panelling on the walls, an elaborate frieze, ornamental ceiling and rich old marble chimneypiece; the carved furniture, ebony cabinet, carved with the story of Jonah, andirons and sconces were particularly noticed, also the interesting portraits—Robert, second Earl of Dorset and Margaret, second Countess, by Deborers; Edward, fourth Earl, the hero of the murderous duel with Lord Bruce, fought without seconds under the walls of Antwerp, 1613, and a devoted adherent of Charles I., a fine portrait in armour and red dress (Vandyke); Charles, sixth Earl "Dorset, the grace of courts, the Muses' pride," whole length, in robes and collar of the Garter, white stick in right hand (Kneller); John Frederick, third Duke of Dorset (Reynolds); Lord George Sackville (Gainsborough) half-lengths, seated in court dress.

The crimson drawing-room (or Sir Joshua Reynolds's room) contains the best and most interesting pictures, apart from the portraits at Knole. A sibyl (Domenichino), a replica of the Marquis of Hertford's picture, Judith with the head of Holofernes, a powerful picture (Garofalo); Cupids at Play (Parmigiano), a charming picture; Mary Queen of Scots (Zucchero); Henry VIII. (Holbein); A Morning Party (Wouvermans); Frances, fifth Countess of Dorset (Vandyke's best style of courtly elegance); Card Players (Ostade); A Village Fair, or Kermis, and a Guard Room (Teniers), much admired; Travellers by the Wayside (N. Broghem), a crisp piece of work; half a dozen semi-historical and fancy subjects by Sir Joshua Reynolds, help to glorify the room; Robinetta

an arch little damsel, feeding her caged bird, whilst her dog peeps over her shoulder; The Fortune Teller, another of the master's best known and most-admired works; the portrait of a Chinese Boy, who had been educated in Sevenoaks; and a portrait of Madame Schindlerm, the singer.

The cartoon-room, 90 feet by 18 feet by 15 feet high, is so named from certain early copies in oil, said to be by D. Mytens, of the six celebrated cartoons by Raphael. The furniture, silver and irons, sconces, chandeliers and mirror frames are memorable and were much admired, also the curious seventeenth-century treasury and travelling chests, and also the Gobelin tapestry, the principal pictures in this gallery which were noted being that of Lord Albemarle (by Dobson) and George IV. in regimentals (by Lawrence).

The King's Bedroom was next inspected. It is so called from having been fitted up for the reception of James I., and only used by him. It contains original furniture said to have cost 20,000*l.*, the bedstead and fittings of gold and silver tissue having cost 8,000*l.* The tables, sconces, mirror frames, baskets and vases are of chased silver. The rich silver toilet service which stands on the dressing-table was not a part of the original royal furniture, but bought at the Countess of Northampton's sale in 1743. The cabinets, one of ebony, the other ivory carved, are choice of their kind. In the ivory cabinet are two chamberlains' keys of office.

The dining-room is devoted to wits and poets. The first and sixth earls were poets themselves and the friends of poets. The portraits of Chaucer, Shakespeare, Sir Philip Sidney and Sir Walter Raleigh were shown; that of Ben Jonson, the well-known portrait by Honthurst; and Otway, by Lely; Thomas Flatman, by himself; Cowley, by Du Bois. The Knellers are numerous; at their head is the earl himself, Dryden, Locke, Newton (supposed Kneller), Sir Charles Sedley, &c. A picture by Vandyke of Sir Francis Crane and himself; Addison and Waller, both by Jervis; Handel, by Denner. By Reynolds are several of rare interest, including his own portrait, Johnson, Goldsmith, Edmund Burke, Garrick, Mrs. Abingdon, and one of Sir Walter Scott, by Phillips, R.A., all of which were much appreciated.

To conclude, in the words of Horace Walpole, "The park is sweet with much old beech, and an immense sycamore before the great gate which makes me more in love than ever with sycamores."

The beeches are even finer than the sycamores, with tall silvery boles, splendid foliage and wide branches, trees in themselves. The oaks are almost equally fine, and one now a venerable ruin, its hollow trunk 30 feet in circumference, was known as an old oak more than two centuries ago.

The broad beech avenue which we have traversed led to a point at the south extremity of the park, about 600 feet above sea-level, from whence was obtained one of the finest views in the county, looking over Tunbridge Castle, Hever Castle, Penshurst and Eridge, and the entire Weald of Kent to Ashdown Forest. Finally, in the words of our esteemed member, Mr. W. Harradence, who in a letter to me says, "Of the treasures of the house and the beauties of the park one never tires."

TURNER'S "KILGARRAN CASTLE."

IN the article on the Guildhall Exhibition which appeared in *The Architect* of April 14 it was said:—

"The earliest picture—for chronology is respected in the hanging—is 'Kilgarran Castle,' which was painted in 1799. Turner was then twenty-four, and had gone through a laborious education imposed by himself. The castle stands on a rocky hill, which is separated from another of similar form by a narrow V-shaped opening through which a river passes, connecting as it were the sky with the river Teif, which is in the first plane. The hills indicate that in those days Turner was impressed with mountain beauty, and drew rocks with as much care as an anatomist would take with a skeleton. There is a replica also exhibited which is in a much brighter condition, but the only other difference we can perceive is in the laying on of the paint, and both show a treatment which would not now be considered as the most effective. 'Dunstanborough Castle' was a subject which enabled him to contrast rocks and sea as worthy opponents. 'A Mountainous Scene with Cattle,' dated 1802, indicates some of the mystery in cloudland which Turner was afterwards to reveal, and another disturbed sky is to be seen in a small view of 'Kilgarran Castle.' The fine 'Conway Castle' also belongs to 1802. Here, in defiance of rules, he places the building in the centre of the picture, and in representing it we see that loving labour to do justice to architecture, as if a building were comparable to a work of nature, which characterises his earlier architectural drawings. When he introduced a barge on the shore, with its sloping mast, he also rebelled against an accepted principle. Turner had a curious perversity for inclined lines, and especially with trees. He may have thought the verticality of other forms was made more emphatic in that way, but it is more likely the contrast was intended to show his disregard for an arrangement that he considered to be conventional."

We are glad to see our theory of the peculiar technique in the two pictures is confirmed by so experienced a painter and expert as Mr. James Orrock, who in a letter to the *Times* says:—

As it has been my privilege to have the opportunity of studying Turner's pictures, in my own house, both in oil and water-colour, for about forty years, I feel that I have some claim to a voice in the controversy which is taking place in your columns about the "Kilgarran Castle" (No. 3) now in the Guildhall Exhibition. I have carefully examined, with delight, the Turners in that magnificent collection, and agree with all in thanking Mr. Temple for the delight and instruction he has given to all lovers of English art. I admit, however, when I came to the No. 3 "Kilgarran" I stopped dead, and wondered at the comparative coldness of tone of this Turner. After a minute examination of that picture, however, I came to the conclusion that it was genuine. My reasons are—first, it is Turner's colour, what we know as the painter's "voice," which, although not so rich and mellow as in most of his works of that period, still, considering the shameful treatment it has had from the hand of some unscrupulous and ignorant cleaner, it is, nevertheless, strong enough to distinguish the "voice" of that master. The second reason is the fact, which on careful examination is an absolute proof, viz. the presence of myriads of sand-like particles which Turner at that period almost always sprinkled "rough-cast" on the middle portions chiefly of his pictures, his object, of course, being to give air to the middle distance, without deadening the colour by mixing with it opaque paint. This can be clearly demonstrated in most of the Turners of that date now in the Guildhall. As to the history which Mr. Rawlinson speaks of regarding the Monro Catalogue, nothing might be more deceiving. The picture may have been in what one knows as the "box-room collection," which exists in most amateurs' houses, and which might, with others, have been missed out, or left out in ignorance. Monro, being as Mr. Rawlinson truly states, "the intimate friend and patron of Turner," would hardly be the man to have so important a picture, and which is now declared to be a false one, from the easel of his god. It is still less likely that a man who had always his pictures from Turner himself should allow a false one to infect the collection of works by his illustrious friend.

The technique, I admit, is not quite so clear as might be, but it is nevertheless that of a master and a colourist. Personally, judging from long experience, I firmly believe that artistic colour, not the imitation of natural colour, has always been the rock upon which the multitudes of history-men and most others split. Our greatest landscape painters have always suffered from neglect and contempt, and, indeed, with few exceptions, have suffered in the main also from the majority of their brother artists. The times may be changed now, but still the greatest colourist and painter per se suffers to-day. Mr. Rawlinson's remarks about the difference between sunrise and sunset are scarcely conclusive. On canvas they can only be described from "incident" or by a title. Perhaps Mr. Rawlinson, when he speaks of the effect of sunset in No. 3 "Kilgarran" being painted for early morning, has not observed that the same ruthless hand of a cleaner has scoured and ground down the thick impasto "behind the trees on the ridge," and has not only taken all the life out of the sky, but has scrubbed the edges of the trees quite away in some places. Would not the whole picture have lost tone from such scarification; and would it not have been likely, to quote Mr. Rawlinson's words, to be "a powerful and attractive work, coming as it did from the Novar collection" before it had been stripped of its tonings and glazings which it doubtless had when it left Turner's studio? One is only surprised that after such drastic treatment anything like the original is left. MacWhirter in his letter says Turner did not repeat himself. I can prove to him he did in the case, for instance, of the small but exquisite drawing known as the Berwick in the Scott series. There was only one master, however, who had the artistic colour of Turner in his early time—the Rev. John Thomson, of Doddington, who know Monro and also Turner. But those who know both masters well know their peculiar characters. I have never seen the speckled, sandy-looking texture in Thomson's pictures, or indeed in any other pictures. Müller's use of ground plaster casts was not to rough-cast parts of his pictures, but to mix the prepared powder in the colour which he used. The intention, however, of both masters was the same. Having been a collector for more than forty years, and having the honour of having half a dozen fine Turners in my possession, I have felt it my duty to state what I know, so as if possible to clear up this so-called mystery. I beg to apologise for taking up so much of your valuable space.

Fifteen Architects have sent in plans for the reconstruction of the Mid-Lothian County Buildings. The assessor is not yet appointed.

THE DUMBUCK CRANNOG.

THE work of examination and excavation of this remarkable archæological discovery still continues (says a correspondent of the *Glasgow Herald*), as does the lay and scientific interest in its features and revelations. In a world-wide correspondence which has flowed in upon Mr. Donnelly, the discoverer of the crannog, it is seen that the conditions of the Clyde in the distant past have a very wide interest both for the student and the historian. Since its discovery in July last year the crannog has been visited by some dozen learned societies and thousands of the general public. It has also been the special study of experts in this field of archæology, with the result that the find stands to-day an assured evidence and relic of the ancient dwellers on the banks of the Clyde—the men of the Stone Age. Amongst the eminent scientists who have taken special interest in the crannog, and in practically examining the objects recovered from it, is Sir Arthur Mitchell. Sir Arthur, after hearing Mr. John Bruce's paper read before the Society of Antiquaries in Edinburgh, suggested that Mr. W. A. Donnelly, artist, should, besides his large collection of drawings of the crannog, its features and finds, execute a number of sections and all still remaining unrecorded features. Sir Arthur further extended his sympathetic interest by requesting Mr. James Deas, sen., engineer to the Clyde Trust, to include this crannog in the present survey being made of the Clyde and foreshores, and the taking of levels on and near the crannog. This has been done. Mr. Deas instructed two of his assistants—Mr. Robertson and Mr. Mitchell—and their men to make a special and minute record of the crannog site, features and levels. This work has been executed to the entire satisfaction of Mr. Donnelly, who guided in the work in such a way as to make it possible to have many important features recorded which, under other circumstances, would have been omitted, or would have cost much expense and labour to re-excavate. At the crannog these June days the scene was very picturesque, the boats of the Clyde Trust riding idly in the offing, while the sun-browned Clyde Trust men, so physically fit, toiled and laboured in the tropical sun, guided by Mr. Mitchell and Mr. Robertson. Many cuttings and sections were made, east, west, north and south. Mr. Donnelly made it possible for them to do what has not hitherto been done—a section right into the crannog proper, wedge-shaped, in fact, a segment of the circular structure, revealing the fact so often recorded, that it is a timber structure not a stone one. Several valuable finds were made while prosecuting this work—some stone spear-heads and also horn implements, large teeth, ribs and chisels of horn. Mr. Robertson also unearthed a very formidable oaken war-club 4 feet 6 inches long. The outstanding feature was revealed that the crannog was built on the secure foundation of a splendid bed of the finest blue clay. When Mr. Deas has his plan and sections made from the very exhaustive measurements and levels it will form an independent and authoritative chart from which the actual position and levels of the crannog can be ascertained. The work was very trying in the waters and mud of the foreshore under a sun which recorded a temperature of 117 degrees in the light. Scientists all over the country are greatly indebted to Mr. Deas for the sympathetic and practical manner he has approached this antiquarian work, and Mr. Donnelly speaks in glowing terms of the efficient and practical manner in which the Clyde Trust men have executed the work on every occasion. Mr. Donnelly and his men, on behalf of the Helensburgh Society, have excavated 30,000 cubic feet of clay, sand and mud since first the excavations were begun. Some of the most important parts are yet to be done, such as the well, the southern breakwater and the dock in which the great war-canoe was found. Advantage is being taken to have this work done while the weather is favourable, and, as hitherto, all important facts of value will be recorded in the press.

GERMAN CRITICISM OF AMERICAN ARCHITECTURE.

IN a notice of American architecture apropos of the recently-published book of Paul Gräf, "New Structures in North America," the *Berliner Tageblatt* says :—

When the German architects, who have been in Chicago, are asked how they build over there, they answer, with a certain significant look, "Donnerwetter." And they are right. The same exclamation of admiration is called out by Paul Gräf's book, and it is not only a platonic satisfaction that finds expression thus, but at the same time the feeling that there is something to be learned from it.

To begin with, the simple practicality of the buildings is to be observed. The qualities that so often come to the front in German buildings, straining for effect, intentional conspicuousness and strangeness, are entirely lacking. "Most of us," remarked Gabriel Seidl recently, "build not a house, but a poster for our building business." For this reason the decoration goes beyond the limit of what is necessary and in good taste. The Americans know as little of this "architecture game" as our older architects; they have the same sound, craftsmanlike feeling that lays all the stress on the thing done, none at all on exploiting the person who does it.

In the next place, admiration is called forth by the originality of each house, its individuality, gained only through the fact that its form is determined in each case by its interior arrangement, and nothing is built for the sake of the façade. That is the reason, in the last analysis, why there is seen so little ornamentation intended merely to cover the intellectual poverty of a façade.

In the third place, the observer is struck with the way in which delicate decorative elements of old periods are utilised. The builder is never under the sway exclusively of one old style. Antique art is not to the child of this country, which has no old castles and no traditions, something that he must accept in its entirety, whose style he must copy with scientific accuracy; it is, on the contrary, as it was to the artists of the Early Renaissance, a treasury of "motives," with which he can work freely, according to his taste. It never occurs to him that he must build a Romanesque church or a Romanesque house; but he builds a modern church or a modern house, for which he chooses here and there a Romanesque decorative motive. Compare the little churches in Detroit with the Berlin churches and see what this means. Our churches are almost without exception school examples of old styles; on their walls is piled everything that has been preserved as an ornament of the period, not on one building, but on many. Their effect is always cold and petty, while the American churches mentioned have a pleasant and dignified appearance, though almost without ornamentation. Or compare the Romanesque house of Chicago with the Romanesque Kaiser Wilhelm Memorial Church, which, with its endless round-arch arcades, has the effect of a mausoleum. And in the American building, how gracefully the ornamental capitals come out as central points, while in the Berlin church the mass of uniform ornamentation leaves no impression.

On examining in detail the chief points of superiority in the effect of American buildings a special charm is found in the admirable use of the material. The rough peasant-like finish of the hewn stone, though it often seems a little exaggerated for our taste, gives, nevertheless, the impression of being hand-work, and quite excludes the idea of machine-like smoothness that with us is a dominating one. By the contrast with smooth blocks or simple surfaces of terra-cotta or of wood, or both, fine artistic effects are produced.

Now what is the significance of these buildings for us, for our architects and builders? Are they models to be copied? Certainly not, for their own lesson is precisely against imitation. They tend rather to stimulate design according to the need predicted by each building, according to the material at hand and according to the national taste. They tend to show us how great the possibilities are in such a procedure; how much more genuine richness lies in following it than in exaggerated bedizenment with superfluous ornamentation. Our best architects, indeed, are travelling in this same road. But the American buildings speak more plainly on account of their energetic and almost extreme carrying out of this tendency.

And these teachings are not limited to exterior architecture. The same spirit has controlled the planning of the comfortable interiors, which are, to be sure, better known to us, and have had their influence.

TESSERÆ.

Chiaroscuro.

THE ends which chiaroscuro subserves are three—first, by dividing the surface of the picture into light and dark masses to please the eye and prevent that confusion and perplexity incident to its being attracted by too great a number of parts of equal importance at once; secondly, to relieve or push into notice the principal objects and to keep others in proper subjection, or sink them into obscurity according to their several degrees of consequence or use in the composition; and lastly, by the manner of it to aid expression and give the first impression of the nature and predominant sentiment of the piece. But whether the shadows roll in midnight masses, enveloping the greater part of the picture, or are so faint as to be scarcely perceptible; whether they break with abrupt violence or sweetly and gently steal upon the sight; whether they are warned and enlivened by reflexes or preserve a sullen and uniform breadth, one quality they should never under any circumstances be without, and that is transparency, which, at the same time that it is indispensable, is unfortunately one of the greatest practical difficulties of art. Of that which depends on delicacy of eye, dexterity of hand and practical knowledge of the materials, little of course can be explained by words; but every one will easily perceive, by experiment and by study of the works of others, that a dark colour laid thin upon a light

one will generally appear clear and pleasant, but that a light colour laid thin upon a dark one is almost always opaque and disagreeable. Hence the most efficacious way of preserving the transparency of shadows is to paint them rather faint at first and give them their full warmth and depth by a second operation. The chiaroscuro of a picture does not, however, depend on lights and shadows merely. Hot and cold, bright and dark colours, start from and avoid one another with nearly as much vivacity as light from shadow; but a composition painted entirely on this principle will necessarily be feeble and flimsy from the want of roundness and depth which it is the property of shadow alone to bestow. Good pictures must partake of both principles, leaning to the opposition of colours in subjects of a gay, and to the opposition of light and shadow in subjects of a graver or grander cast. But, whatever the subject, the principal mass of light should maintain its pre-eminence in size and splendour like the centre of the system from which all the others emanate and by which they are supported. Let the inferior ones be diversified in shape and quantity as much as possible, for equal quantities and similar shapes always produce hesitation and perplexity unless the reason for it be immediately obvious; and in addition to this let the masses, if possible, lie somewhat in an oblique or diagonal direction with respect to each other, by which they will appear to fall more naturally into the stream of light, and consequently be more pleasing to the eye.

John Riley.

This painter, who was born in London, 1646, was the first Englishman that attained any excellence in portraiture, unless perhaps Dobson may be considered as an exception, and in that department he remained unrivalled by any native artist until the appearance of Sir Joshua Reynolds. He was instructed in his art by Fuller and Zoust, but he adopted Vandyke as his model, and painted much in the style of Lely. His draperies were admirable. Riley was a modest and unassuming man, and excessively diffident and distrustful of his powers. "With a quarter of Sir Godfrey's vanity," says Walpole, "he might have persuaded the world he was as great a master." And the same writer observes that his "talents while living were obscured by the fame rather than by the merit of Kneller, and depressed since by being confounded with Lely, an honour unlucky to his reputation." Upon the death of Sir Peter Lely, Riley came into general notice and obtained the patronage that he merited. He was introduced to Charles II. and painted his portrait, who said, upon seeing it, "Is this like me? Then, odd's fish, I am an ugly fellow," which greatly disconcerted the modest painter. He painted also the portraits of James II. and his queen, Mary of Modena, and after the Revolution in 1688 he was appointed State painter to William and Mary, whose portraits he also painted. Riley's masterpiece is reckoned the portrait of the lord-keeper North at Wroxton, and amongst his most successful performances are mentioned also the portraits of Bishop Burnet and the celebrated Dr. Busby, master of Westminster School. Riley died in London of the gout, 1691, in the forty-sixth year of his age. His property, which, according to Walpole, amounted to only 800*l.*, came to his scholar, Richardson, who had married his niece.

The Italian Sala.

In its stricter architectural meaning, saloon (from the Italian sala and its augmentative salone) signifies a room answering in some respect to the idea of a hall, that is, not only the principal room as to spaciousness, but loftiness also, height belonging to the character of a saloon in like manner as length does to that of a gallery. Thus if the plan be square, the proportions may vary from those of a cube to a cube and a half, or even more in height, but should never be much less than the first-mentioned. Like all others, however, this rule admits of exceptions, because a room may be both lofty in itself and in comparison with the others in a building, although its proportions may not be strikingly so. It is further usual for a room of this description to be either a perfect square in plan or of some shape that can be inscribed within such figure, that is, circular, octagonal, or some other regular polygon. At present, however, the term is not understood in so strictly technical a sense, but the name of saloon is indiscriminately or ostentatiously bestowed on any unusually large room, be its proportions and character what they may, even though it would answer better to that of a gallery. Except that it is not used for banquets, the saloon may be considered, in modern residences, what the hall was in the mansions of "olden times." Its destination differs from that of drawing-rooms and other apartments of that kind, as serving rather as an approach to and communication between them, and as a room of general rendezvous for the visitors at a house. Blenheim, Castle Howard and other mansions erected by Vanbrugh have lofty and stately saloons; but one of the most splendid modern examples of the kind would have been that designed by Adam and published in his works, for Sion House, the inner court of which he proposed to convert into a magnificent rotunda enclosed within a circular or ring-shaped gallery, with openings from one to the other between columns, and with niches in the intermediate piers.

Schiller's Æsthetics.

The doctrine which Schiller has often inculcated is that to Man there rests but the choice between the pleasures of sense and the peace of the soul, but both are united in the life of the Immortals, viz. the higher orders of being. Still it may be ours to attain, even on earth, to this loftier and holier life—provided we can raise ourselves beyond material objects. The Fates can only influence the body and the things of time and matter. But, safe from the changes of matter and of life, the Platonic Archetype, Form, hovers in the realm of the Ideal. If we can ascend to this realm—in other words, to the domain of Beauty—we attain to the perfection of Humanity—a perfection only found in the immaterial forms and shadows of that realm—yet in which, as in the gods, the sensual and the intellectual powers are united. In the Actual Life we strive for a goal we cannot reach; in the Ideal the goal is attainable and there effort is victory. The Ideal is not meant to relax but to brace us for the Actual Life. From the latter we cannot escape, but when we begin to flag beneath the sense of our narrow limits and the difficulties of the path, the eye, steadfastly fixed upon the Ideal Beauty aloft, beholds there the goal. In Actual Life strength and courage are the requisites for success, and are doomed to eternal struggle, but in the Ideal Life struggle exists not; the stream, gliding far from its rocky sources, is smoothed to repose. In the Actual Life, as long as the artist still has to contend with matter, he must strive and labour. Truth is only elicited by toil—the statue only wakens from the block by the stroke of the chisel; but when he has once achieved the idea of Beauty, when once he has elevated the material marble into form, all trace of his human neediness and frailty is lost, and his work seems the child of the soul. Again, in the Actual world, the man who strives for Virtue finds every sentiment and every action poor compared to the rigid standard of the abstract moral law. But if, instead of striving for Virtue, merely from the cold sense of duty, we live that life beyond the senses in which Virtue becomes as it were natural to us; in which its behests are served not through duty but inclination, then the gulf between man and the moral law is filled up; we take the Godhead, so to speak, into our will, and Heaven ceases its terrors when man ceases to resist it. Finally, in Actual Life, sorrows, whether our own or those with which we sympathise, are terrible and powerful; but in the Ideal World even Sorrow has its pleasures. We contemplate the writhings of the Laocoon in marble with delight in the greatness of Art; not with anguish for the suffering, but with veneration for the grandeur with which the suffering is idealised by the artist or expressed by the subject. Over the pain of Art smiles the Heaven of the Moral world. Man thus aspiring to the Ideal is comparable to the Mythical Hercules. In the Actual world he must suffer and must toil; but when once he can cast aside the garb of clay, and through the Ethereal flame separate the Mortal from the Immortal, the material dross sinks downward, the spirit soars aloft, and Hebe (or Eternal Youth) pours out nectar as to the gods.

GENERAL.

The Painting by Mr. Ernest Crofts depicting the opening of the first Royal Exchange by Queen Elizabeth will be unveiled in the Royal Exchange on Monday next. It is the gift of the Mercers' Company.

Mr. James Lovegrove, who has been surveyor of Hackney for over forty years, having retired, he was on Saturday presented by the staff with an illuminated address.

The Marquis of Granby will preside over the fifty-sixth annual Congress of the British Archæological Association, which will be held at Buxton during the week which commences on July 17.

Mr. Walter Armstrong, director of the National Gallery of Ireland and formerly an art critic in London, received knighthood on Monday at the Viceregal Lodge, Dublin.

The Queen has subscribed 100*l.* towards the fund for the restoration of the Abbey of Paisley, where so many members of the Royal House of Stuart lie buried.

Mr. S. W. Williams, architect, of Radnor-High Sheffiras shire, has sent the treasure-trove found by a boy near Rhayader to the British Museum. It consists of a gold ring set with onyx, a gold armlet in four pieces, and a gold necklet in ten pieces.

Mr. G. J. F. Bryant, who was the senior practising architect in Boston, U.S., recently died in that city. He was born in 1816, and designed an immense number of buildings. For several years he served as supervising architect of the Treasury Department.

THE

Architect and Contract Reporter

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

TRADE NOTES.

MESSRS. BURNHAM, WILLIAMS & CO. announce that their London office has been removed from 36 Lime Street, E.C., to 110 Cannon Street, E.C.

MR. CHARLES MYERS, contractor, Woodhouse Street, Leeds, announces that he has taken into partnership his two sons, John S. Myers and C. Frederick Myers, and that in future the business will be carried on under the style of Charles Myers & Sons.

MESSRS. ARCHIBALD SMITH & STEVENS, of Queen's Road, Battersea, ask us to mention that all the hydraulic lifts fitted at the new Royal Hotel, Weymouth, a notice of the opening of which appeared in our issue of May 19, were supplied by them.

THE Endowed Schools, Watford, are being warmed and ventilated by means of Shorland's patent Manchester grates.

THE large clock in the central tower of the Hotel Great Central, Marylebone Road, has four illuminated dials, each 8 feet 6 inches across, and has been made and erected by John Smith & Sons, Midland Clock Works, Derby.

THE recent disastrous fire at the Hotel Windsor, New York, seems not to have failed in impressing hotel proprietors with their responsibility in securing the most efficient means for the protection of their premises from fire. It is therefore satisfactory to learn that the Royal Pavilion Hotel at fashionable Folkestone, has just been fitted up with an additional supply of fire appliances by Merryweather & Sons, of London, thereby rendering the lives of its many visitors much more secure.

MESSRS. JAMES SUMMERHILL & CO., Beaver Works, Wolverhampton, are meeting with considerable success in the introduction of their patent carburised iron, which is largely superseding galvanised iron in the various uses to which the latter has been hitherto applied. It is claimed that the black carburised iron is practically unacted upon by any of the mineral acids which, when the iron is properly coated, produce no effect on it whatever. Pure water also has no effect on it, so it is eminently suitable for the manufacture of vessels for domestic purposes.

BUILDING AND BUILDERS.

IT has been decided by the Keighley Parish Church Council to proceed with the renovation scheme at once, as far as regards the new west entrance and outside repairs.

THE erection of a new Primitive Methodist chapel in Station Road, Pendlebury, is to be commenced at an early date. The old chapel is being demolished.

THE University authorities at Oxford have sanctioned the plans of a pathological block in connection with the University Museum. The total cost is estimated at 10,000*l*. The architect is Mr. J. Augustus Souttar, 61 Gracechurch Street, E.C.

MEMORIAL-STONES were laid on Tuesday in connection with the new Wesleyan chapel now being erected in Boothferry Road, Goole. The building, which is expected to cost between 3,000*l*. and 4,000*l*., is in the best part of Goole, and will be supplemental to the chief church of the circuit.

AT the meeting of the Ripon Guardians on the 22nd inst. a report from the building and board-room committees was adopted recommending that Mr. G. Corson, of Leeds, should be asked to prepare plans and report on the ventilation of the infirmary and the better accommodation of the Board-room.

A SUITABLE site has been secured in the Whitehall Road, Cradley Heath, for the erection of a mission church in connection with St. Luke's parish. The estimated cost of the building is about 300*l*, towards which the Church Diocesan Society have contributed 30*l*.

BLUE POSTS, ARLINGTON STREET, W.

THE new chapel at Malvern College was dedicated on Friday last. Built from a design by Sir Arthur Blomfield, A.R.A., it will accommodate about 500 boys and the teaching staff. The cost, when completed, will be nearly 13,000*l.* Old Malvernians have promised an organ, and a gift of a stained-glass window has also been made.

A MEETING has been held at Malahide, near Dublin, to raise funds for the erection of a spire to the existing tower of St. Sylvester's church. More than 1,100*l.* were raised at the first meeting, and it is anticipated that the work will cost about 2,000*l.* The designing will be entrusted to Mr. J. J. O'Callaghan, F.R.I.A.I., architect, 16 Nassau Street, Dublin.

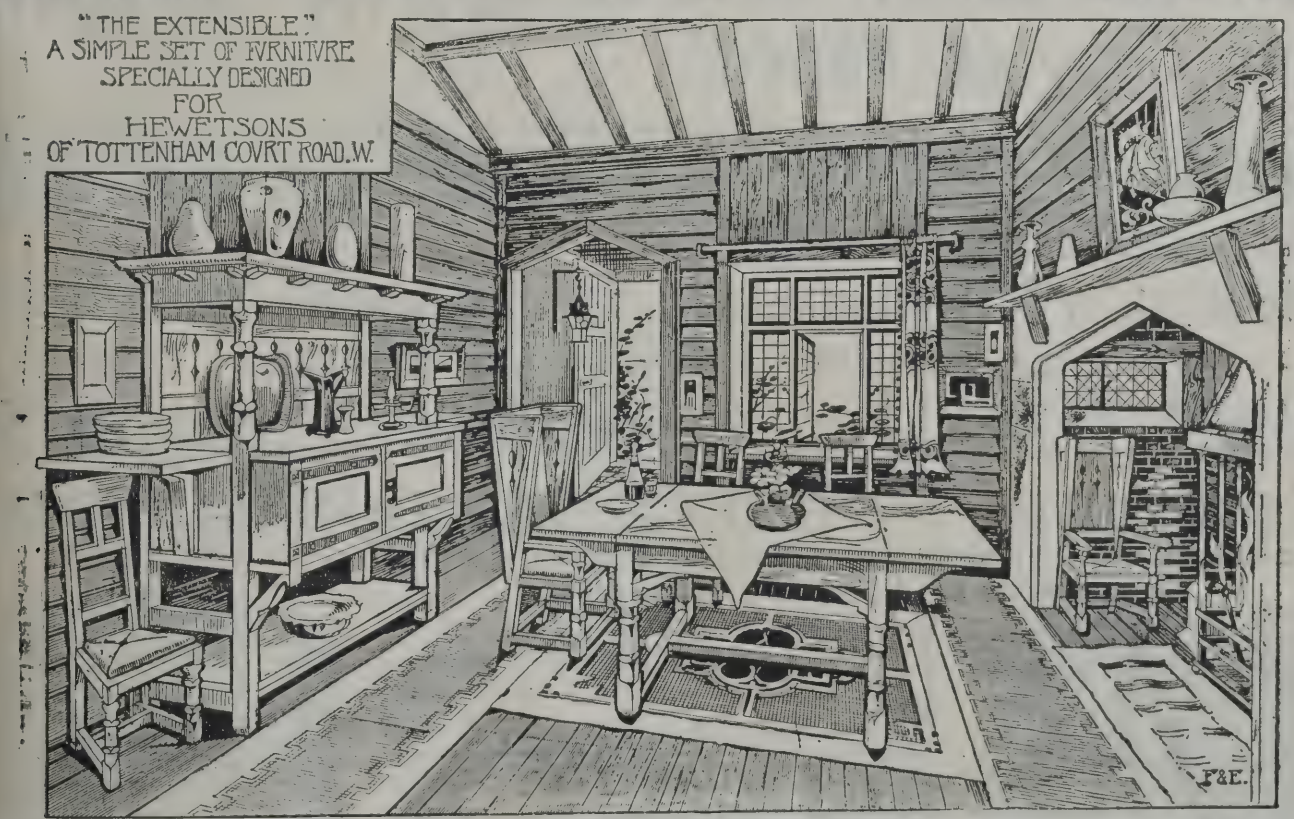
THE memorial-stones of a new Wesleyan chapel, in course of erection at Nettleham, near Lincoln, were laid on the 21st inst. The site of the chapel is at the Lincoln end of the village, on what was known as the Bishop's Park. The building will cost over 1,000*l.* The contractor is Mr. R. Mawer, of Louth, and the architects are Messrs. W. Mortimer & Son, of Lincoln.

MESSRS. ASPINALL'S ENAMEL, LIMITED, New Cross, London, S.E., advise us that they have commenced rebuilding their extensive premises at New Cross, which were totally destroyed by fire last year, and hope to have them completed by the end of November. The architect is Mr. Max Clark, of Queen Square, W.C., and the contractors are Messrs. L. Whitehead & Co., Limited, Portland Works, Clapham Road.

THE dedication of the church of the Holy Trinity, Newington Avenue, Belfast, took place on the 25th inst, the ceremony being performed by the Right Rev. Dr. Henry, Bishop of Belfast. It has been erected at a cost of 4,000*l.*, and is of suitable design for the surroundings. It is believed that it is Dr. Henry's intention to erect many such churches in his diocese, rather than erect fewer and more pretentious buildings.

THE memorial-stones of new schools in connection with Brookfield Unitarian Church, Gorton, were laid on Saturday. They are in line with and in close proximity to the church, with which they will harmonise, being of parpoint stone with ashlar dressings. There will be a large central hall for meetings and entertainments, surrounded by classrooms, and it is anticipated that the increased accommodation provided will be adequate for a long time to come.

THE building plans sub-committee of the Leeds Corporation had a "record" meeting on Friday last with regard to the number of new plans which came before them. The total number of plans inspected was 143, which included 10 which had been postponed, and 133 new plans. The latter dealt with 275 houses, 13 warehouses, workshops, &c, one clothing factory and one engineering works. Most of these were passed.



A SERIOUS fire occurred late on Sunday night at Guttridge's brickworks, Brighton. Three workmen were drawing some paraffin from a cask in a shed, when the oil ignited from a candle held by one of the men, setting the whole of the building alight. Two of the men were terribly burned and were removed to the county hospital, where one succumbed to his injuries on Monday. The third man marvellously escaped injury. The building was destroyed.

THE contracts for the first section of the scheme for the restoration of Paisley Abbey have been fixed as follows:—Mason, joiner, slater and plaster work, Messrs. Boyd & Forrest, Kilmarnock; plumber work, Messrs. Jas. Kilpatrick & Sons, Paisley; glazier work, the Glass Stainers' Company; iron and steel work, Messrs. J. M'Millan & Co. The first section of the work comprises mainly the restoration of the transepts and the arches for the central tower, and the estimates amount to about 13,000*l.*

AT last week's meeting of the Tendring Board of Guardians the Local Government Board intimated that they would be prepared to sanction the increased loan for the new infirmary which would be necessitated should the Board accept the lowest tender opened at the previous meeting. A resolution accepting the lowest tender—that of Mr. Shurman, of Ipswich, at 10,799*l.*—was eventually passed. It was incidentally mentioned that the tenders came out about 40 per cent. in excess of the estimate, a result attributed to the rise in the cost of material and labour.

THE new county hospital at Bedford was opened last week by the Duke of Bedford, who, together with Mr. S. Whitbread, has been a great benefactor to the hospital. The buildings stand in the grounds adjoining the old infirmary, which is to be pulled down, and the site covers 10 acres. The three wards

HOTELS, CLUBS, AND PUBLIC INSTITUTIONS COMPLETELY FURNISHED.
HEWETSONS, TOTTENHAM COURT ROAD, LONDON, W.

for men, women and children are built on the pavilion system, and are over 100 feet apart. The administrative block, the operating block and out-patient's departments are all separate. A handsome chapel is provided, and there is a nurses' home, which has been built as a county memorial of the Queen's Diamond Jubilee. The cost of the whole hospital is 38,000*l.* The architect was Mr. H. Percy Adams, of London, and the contractors Messrs. Kerridge & Shaw, of Cambridge.

THE memorial-stones were laid on Saturday of the new Free church which is being erected in Grace Drive, Linthouse, N.B., on a site which was purchased for 909*l.* It contains about 2,530 square yards, and space has been reserved for the future erection of a manse. The new buildings comprise a church containing about 1,000 sittings, a hall with upwards of 300 sittings, a session-house, which may be added to the hall by means of folding doors, a vestry, a ladies' room, a church officer's house, and other necessary accommodation. They were planned by Mr. James Miller, architect for the 1901 Exhibition buildings, who has been able to combine commodiousness and economy with novel, simple and yet effective architectural details. The total estimated outlay was 7,800*l.*

A NUMBER of steeple-jacks had a tragic experience on Wednesday at Bridge Mills, Tintwistle, near Manchester. The main building of the mill was recently destroyed by fire, the damage amounting to 50,000*l.* While the men were engaged on the fifth storey demolishing the old walls, several tons of brickwork fell in, crashing through what remained of the wooden floors. Three steeple-jacks were carried down with the falling débris. One, Eli Jones, of Rochdale, was killled instantly, while two others, James Denton and Richard Holt, received shocking injuries. Three workmen narrowly escaped being crushed.

THE Board of Trade have received information from the British Chamber of Commerce in Egypt to the effect that the Municipality of Alexandria will give out in December next a contract for the construction of a large quay and collector drain. Copies of the specifications for this contract have also been received, and can be consulted by persons interested in the matter at the offices of the Board, 7 Whitehall Gardens, S.W., between the hours of eleven and five. Copies of the plans and drawings can be obtained from the Municipality of Alexandria at the cost of 10 Egyptian pounds or 10*l.* 5*s.* 2*d.* sterling. The Chamber of Commerce also state that a loan of 500,000*l.* is contemplated in order to pay for the work, and that this loan will probably be issued at the beginning of next year.

VARIETIES.

THE Archbishop of Canterbury consecrated the new church of Emmanuel, South Croydon, on Monday last.

THE dedication service of the new Welsh church in Lime Grove, Oxford Street, Manchester, took place on the 23rd inst. The building, including site and furniture, has cost about 3,500*l.* The architect was Mr. R. B. Preston, and the builder Mr. Carlyle, jun., Ardwick.

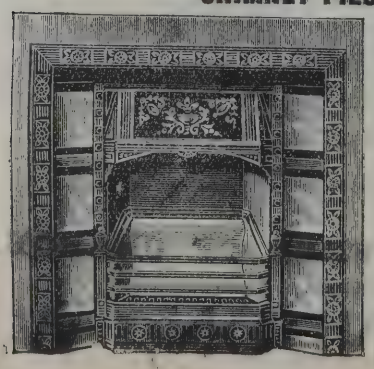
THE historic Derwentwater House, Acton, in the grounds of which there is a monument to the ill-fated Earl of Derwentwater, who was executed for high treason on Tower Hill in 1716, has just been acquired by the members of the Acton Liberal Club as their future headquarters, and as a central registration office.

THE *Standard's* Denver (Colorado) correspondent on Tuesday telegraphed: — Mr. Lewis, a civil engineer from Chicago, has passed through here en route for China, on behalf of a syndicate interested in a concession for the destruction of the famous wall. Two British, one French and three German syndicates are competing.

THE famous Surly Hall hotel, near Windsor, a well-known landmark on the river, familiar to all past and present Etonians, will disappear at the end of the present river season. The property has been purchased by Sir A. K. Rollit, M.P., and the Dowager Duchess of Sutherland, who intend to build a residence there.

THE Bristol Congregationalists have almost completed the task of raising 15,000*l.* in order to secure the offer of 5,000*l.* made by Sir W. H. Wills, M.P., for church extension work in the city and suburbs of Bristol. The amount already subscribed closely approaches 14,000*l.*, and the local authorities anticipate that the balance will be forthcoming within the next few weeks.

IN the course of a service in the old Greyfriars Church, Edinburgh, there was a most unusual occurrence on Sunday. The service had not long started when a smell of gas prevailed. The connection was closed at the meter, but the leakage increased, and in a little while a number of the congregation were overcome, and had to be carried outside. As the escape could not be stopped the service was brought to an abrupt termination.



THE new church in St. Phillip's district of the West Bromwich Christ Church parish was opened on Sunday for public worship. It is pleasantly situated on the Beeches, and

Stable Fittings Requisites.

capable of accommodating 750 persons. The estimated cost was 6,000*l.*, but owing to the lack of funds the major portion only has been erected, at an estimated outlay of 4,000*l.*, and of this there is still 1,700*l.* to be raised. The work has been executed by Mr. John Dallow, and Messrs. Wood & Kendrick were the architects.

THE new extension of the Midland Counties Home for Incurables at Leamington was opened on Wednesday. For some years the demands for admission of patients to the home have been much in excess of the capacity of the existing building to supply accommodation, and two years ago it was decided that, in commemoration of the Diamond Jubilee, an extension should, as soon as funds permitted, be set on foot. A scheme providing accommodation for fifty-three additional patients, and for a new and larger chapel, a recreation-room and more convenient domestic offices, at an estimated cost of 17,000*l.*, was adopted. The accepted plans were those of Mr. Hawley Lloyd, of Leamington, and Mr. W. Henman, of Birmingham. It was decided that the scheme should be proceeded with in sections, and it was the first section—completed at a cost of 7,300*l.*—which was ready for opening on Wednesday. The new wards, which many of the visitors had the opportunity of inspecting, are large, light and airy, and give room for thirty-three additional beds. The floors are of teak laid on concrete, and the wards have been built in accordance with the most modern principles of hospital construction.

A NEW Union church at Beeston was opened on the 20th inst. It has been fitted with all the latest appliances for heating, ventilation, &c., and has been built to accommodate about 400 people. The architecture is of the Perpendicular period, the main front is of Bulwell stone, rock faced with dressings of Coxbench stone, and the roof is tiled with American sea-green slates. The heating of the place is obtained by the low-pressure hot-water system, and the ventilation is on the Boyle system. The benches for the congregation are of Columbian pine, and the materials of the rostrum are pitch pine and mahogany, which are decorated with iron scroll-work. In front of the rostrum is situated the baptistery, let in 3 feet 6 inches below the floor of the chapel, and lined with white glazed bricks. At the rear are minister's and choir vestries, kitchen, and a large schoolroom, 51 feet long by 18 feet wide. The edifice is 66 feet long, 36 feet wide and 37 feet from the floor to the ridge. Mr. C. N. Holloway, of Newcastle Chambers, Nottingham, is the architect, and Mr. W. Turner, of Beeston, the contractor. The building and site have cost 2,684*l.*

THE fine old parish church of Wellington, Salop, which was closed in August last for extensive alterations, has assumed an appearance which entitles the edifice internally to rank among the most beautiful churches in the county. The interior of the structure was formerly marked by its extreme plainness, but this has disappeared entirely under the scheme which, though by no means complete, was sufficiently far advanced for the reopening services to be announced for the 21st inst. Alterations have already appeared in these columns, but the new decorations, Classical in style, consist principally of a magnificent carved oak screen erected over the chancel, and made from wood more than twelve hundred years old taken from the old parish church; a new gallery with improved seating accommodation, supported by marble columns and fronted with neatly carved wood-work, and substantial carved choir stalls have been put in. All the old oak seats in the body of the church, on which great value is placed, have been preserved and refixed in the rearrangement of the side aisles. Prominent among the improvements are the mouldings on the ceiling with various intersections. The general harmony of the decorations is advanced by the introduction of a marble pulpit. It is octagonal in shape, and has panels occupied by figures representing "Christ Preaching to the Multitude," "Christ in the Garden of Gethsemane," "Christ as the Good Shepherd," and "The Ascension."

THE arrangements of the British Fire Prevention Committee for July include the following series of fire tests:—The fire resistance of casements glazed with patent wire glass by Messrs. Pilkington & Co., of St. Helens. The fire resistance of skylights glazed with patent wire glass by the same firm. The non-flammability of a match-boarded partition constructed by the British Non-Flammable Wood Company. The fire resistance of a matchboarded partition, with silicate cotton filling, constructed jointly by Messrs. Anderson and Messrs. Broadbent. The fire resistance of a ceiling constructed jointly by the same firms. The automatic recording of an outbreak of fire on the Pearson automatic fire-alarm system. The fire resistance of a 2-inch solid partition constructed by the Mural Decorations Company. The fire resistance of a floor of wood joists provided by the Mural Decorations Company. The comparative fire resistance of ordinary glazed sashes glazed with 32 oz. glass, plate glass and lead lights respectively. The

The metal sheets have expanded without becoming detached, whilst the wood is simply charred to a depth of about ⅛ of an inch

FULL PARTICULARS AND ESTIMATES FREE.

comparative fire resistance between a 2-inch solid teak door and a 2-inch solid oak door. These tests will be carried out according to the usual procedure of the committee at their testing station near Regent's Park.

THE new Liverpool Stock Exchange, which has been erected at the corner of Dale Street and Exchange Street East from designs by Messrs. Grayson & Ould, was opened on the 23rd inst. The building has been erected in Elizabethan English Gothic style, the material used being red sandstone and Portland stone. Two large windows—probably the largest windows in Liverpool—in Exchange Street East let the light of day into the "room." Over these windows there is a cornice and carved frieze. Two side windows light the members' private rooms. The Dale Street entrance has been abolished, and instead of it there are now two entrances from Exchange Street East. Above each a carved panel, designed by Mr. E. Griffiths, sculptor, of Liverpool. Inside the room is practically the same as before, but there are new adjuncts—large vestibule, secretary's office, telephone and telegraph-rooms, clearing-room and reading-rooms. Though the premises are the same in size, more accommodation is provided, because the space is now better utilised.

ELECTRIC NOTES.

AT a meeting of the Chesterfield Town Council on the 20th inst. it was resolved to proceed at once with the works necessary to the provision of electricity for light and power.

A GOOD joke concerning electric light is just going the round of the Bedfordshire papers. It seems that at Bedford an old lady on seeing electric light in that town for the first time was struck with amazement. After gazing at it for some time, she entered a grocery shop, and addressing the assistant, said, "I say, mister, how do you make that big light o' yours? I am tired of burning paraffin." The shopman replied, "Oh, it is caused by a series of electric currents." "Oh, is it?" said the old woman. "Then weigh me a pound; if they won't do for lighting they'll come in for puddings."

THE Examiners of the House of Lords had before them on Friday last, for proof of complying with the further Standing Orders, a Bill to confirm two provisional orders made by the Board of Trade under the Electric-lighting Acts 1882 and 1888, relating to Leamington Spa. The Bill has already been passed by the House of Commons, and formal proof having been given, the Examiner decided that the further orders had been duly complied with. The Bill will accordingly be reported in the usual course for second reading.

THE Bill promoted by the Central Electric Supply Company, the preamble of which was passed on Friday last, came again before the committee of the House of Lords on Monday, presided over by Lord Brougham, for the adjustment of clauses. A clause was inserted providing that the company should not be entitled, except with the consent of the St. Marylebone Vestry, to open more than one trench with such bifurcation as might be necessary to connect with the stations of the two companies (St. James's and the Westminster) to whom the supply has been restricted by the committee. Another clause so restricting the supply was added to the Bill, which was ordered to be reported to the House.

CANDELABRA FOR ST. PAUL'S CATHEDRAL.

Two massive candelabra will shortly be placed in position at the entrance to the nave of St. Paul's Cathedral. One of the bronze pieces, says the *City Press*, is the gift of Mr. Douglas Murray in memory of his father, a prebendary of the Cathedral, and the other has been presented by the members of the decoration committee. Work on these beautiful ornaments has been in progress for the past three years, and the result justifies in every way the care that has been bestowed upon them. Each piece is 14 feet 6 inches in height. The subject has been taken from the first chapters of Genesis, the underlying motive being "Benedicite, omnia opera." At the angles of the base the white, yellow and black races of mankind are represented by three figures. On the sides of the base, in low relief, are represented "Sin"—Eve eating the forbidden fruit; "The Punishment"—Adam's mortality implied by his labour, and "The Atonement"—Christ's crucifixion. Beasts and birds occupy positions beneath the earth, which is covered with flowers and girdled by the sea. The firmament is represented by a fiery column, around which angels are moving. Above are archangels, who support the rose, from which springs the cross, surrounded by stems for the lamps. These beautiful specimens of workmanship were cast by Messrs. Hollinshead & Burton, of Thames Ditton, according to the designs of Mr. H. Pegram, of 26 Norfolk Road, St. John's Wood. The candelabra are mounted on massive slabs of Irish fossil. When they are lighted by electricity a beautiful radiance will be shed over the whole entrance to the nave, which up to the present has been sadly in need of a better means of illumination.

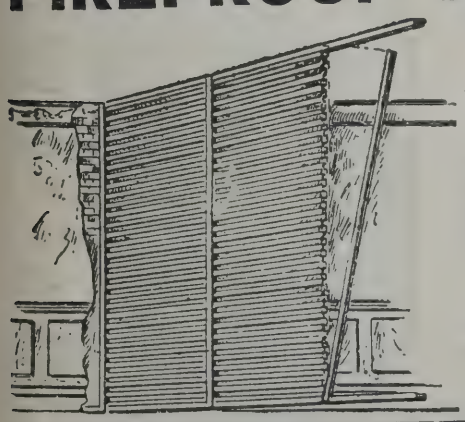
Vol. LX. of THE ARCHITECT. Handsomely bound in Cloth, Gilt Lettered. Price 12s. 6d.

NEW CATALOGUE.

MR JAMES GIBBONS, of St. John's Works, Wolverhampton, and Southampton Row, W.C, has prepared an elaborately illustrated catalogue of artistic door-furniture, consisting of locks, hinges, handles, finger-plates, brass cabinet rim and mortise locks, &c. Designs of all styles and periods are shown by means of excellent reproductions of photographs, and all prices are given. Perhaps the greatest novelty to which attention is drawn is Gibbons's new "Mastership" lock, which is a lock made on a new principle, and suitable for hotels and public institutions, the great advantages of which are at once obvious, as while in making locks to differ with a Master key under the old system, the levers of the locks must all be made the same, on account of the Master key going over them, and

the only variance that is made on the locks is on the wards. It is thus simple for a man to file the ward out and make an ordinary key into a Master key. As has already been done at the Hôtel Cecil, London, Mr. Gibbons varies all his locks on the levers, so that one key does not indicate in the slightest manner what another key may be on the building, and still his Master key, entering through another keyhole, will open all the locks. Thousands of locks may be made to differ entirely on this method, which affords great security in hotels, and has also already been largely adopted in asylums, institutes, banks, &c.

BRICK PAVING.



ACCORDING to the report of the city engineer of Wheeling, in the United States, brick paving has been in use in that city since 1883. To secure satisfactory results he finds it necessary that the brick should be purchased by the Board of Public Works, and inspected at the kiln by a competent man employed by the city. In this way unsuitable material is prevented from reaching the city. During the past year the inspector for Wheeling found it necessary to condemn many bricks. It has also been found advisable in awarding contracts to base the payments on the number of cubic yards of actual excavation, the amount of stone or gravel actually used in preparing foundations, and the number of square yards of sand cushion, bricklaying and sanding. If this method is followed, the contractor has no incentive to slight the excavation or filling. It has been found that contracts of this sort have resulted in greatly improved work, because a good foundation is the most important element of a satisfactory pavement. The present practice, after the excavation has been finished, is to consolidate the subgrade with a 17-ton steam roller; in this way all soft places are detected and can be filled with stone or gravel. When this has been done the foundation is sometimes strong enough to receive the sand cushion directly, but frequently it is necessary to cover it with 9 inches of stone and gravel thoroughly rolled before a suitable base can be obtained. Tar and pitch were formerly used for filling the joints, but it has lately been replaced by sand at a reduction in cost of about 10 cents and without any material injury to the durability of the pavement. On a bad foundation tar has been found of some value in keeping water from softening the earth, but with a well-drained foundation it is not considered essential. Moreover, the use of sand has also made it much easier to repair pavements, as tarred brick are cleaned with difficulty, and even after being cleaned are frequently of little value.

DISCOUNTS IN THE IRON TRADE.

THE proposal of the finished iron manufacturers of Birmingham and the Midlands to discontinue the allowance of discounts has already called forth a strong protest. The following circular, signed by eight of the leading merchants, has been issued to the members of the Association proposing to take action:—

"We, the iron merchants of Birmingham, note that the

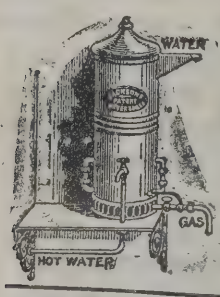
iron and steel manufacturers are discussing a proposal to discontinue the allowance of cash discounts and make the selling price of manufactured iron and steel net. This is a question of such vital importance to merchants (and, therefore, to yourselves), that we ask you to give it your most serious considera tion before deciding to adopt so revolutionary a change of system. It may be taken as absolutely certain that merchants in the distribution of your products amongst thousands of consumers cannot avoid giving long credits, and the only equivalent for such credits, and their only remedy for defence against the dilatory system of payment which is almost universal, is the allowance or disallowance of the discounts they obtain from you. They cannot alter this system of long credits, and net prices would be absolutely disastrous to them. Further, it is by no means certain that, if established, net prices could be maintained when the reaction which is absolutely certain sooner or later to follow the present appreciation of prices arrives. It is impossible to imagine anything more disastrous both to producers and merchants and more calculated to destroy the good relations that ought to exist between them than repeated changes in the system of doing business in trades so important and so open to foreign competition as the iron and steel trades. We beg to protest most strenuously, both individually and collectively, against such a change, and to ask you in both your own and our interests, and we feel sure in the interests of the trade, to vote against it. We believe that 75 per cent. of the iron and steel made in Great Britain is distributed by iron merchants, either home or export, and we think this is an additional justification for our drawing your attention to it."

NEW PHOTOGRAPHIC CAMERA.

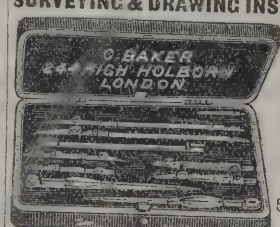


MESSRS. MARION'S most recent introduction is their "cut-film" Swallow hand camera, which will be found to possess many advantages. For a neat-looking and useful camera we can confidently recommend it, and the reasonable price at which it is offered should make it extremely popular. It measures outside 8¼ by 6¾ by 4½ inches, and when loaded with thirty flat quarter-plate films weighs only 4 lbs. The lens is a single achromatic of fixed focus, having three diaphragms, and the definition of the resulting picture is all that can be desired. It is provided with finders for vertical and horizontal pictures. After each exposure, by the turn of a lever, the exposed film is dropped out of the way, and the next one comes into register; at the same time the number of remaining unexposed films is automatically indicated at side of camera. This is the only movement necessary, as the shutter is one of the ever-set type, so that even the novice in photography (provided he uses films of good repute) should be able to produce satisfactory negatives.

A PNEUMATIC DOOR-FASTENER.

THE "Luxurious" bolt is the appropriate name given to an exceedingly ingenious and up-to-date little door-fastener, which is just ready to be offered to the public.

Its mechanism is of the simplest and its efficiency the most complete. An air piston, which can be fixed in any desired position, communicates by means of a small pneumatic tube with the door lock, a bolt in which is thrown or withdrawn by the mere closing or opening of the piston. If, for instance, the piston were fitted at the side of a bed the occupant of the bed could by touching the piston withdraw the bolt to admit a domestic, and on the latter going out of the room the door would automatically lock itself. It is not, however, necessary that the piston be fixed in any special position within the limits of the pneumatic tube, which can be of any length *à discrétion*; it can be shifted about a room or attached to a writing-table or fireside chair to suit the convenience of the occupier. At present the invention is worked out in two forms, *i.e.* as a door-lock and as a simple bolt. The action in both is similar, except that the bolt is not self-closing but must be fastened by means of the piston. We understand that the cost of these appliances, which are suitable for hotels, offices, or private houses, is very small.



THE Town Council of Aberdeen have sanctioned the laying out of the first portion of a boulevard which it is proposed to ultimately carry from Bridge of Dee to Bridge of Don. The thoroughfare will commence in Great Western Road and run thence in a northerly direction to South Stocket Road, opposite the lands of Summerhill. It will be 82 feet in width. The carriageway will be 40 feet wide, and on each side there will be a verge of ground planted with trees, a 10-feet wide pathway, a second verge of ground planted with trees, and a foot pavement 8 feet in width in front of the dwelling-houses which may be erected along the boulevard, and which must be retired back from the centre of the thoroughfare a uniform distance of 25 feet.

PENICUIK HOUSE.

ONE of the most disastrous fires which have occurred in Mid-Lothian for many years occurred on the 16th inst., when Penicuik House was practically destroyed, involving an irreparable loss to art in the destruction of Runciman's magnificent mural painting on the ceiling of Ossian's Hall. The central portion of the mansion, says the *Scotsman*, was built in 1761, to the instructions of Sir James Clerk, in the purest style of Italian architecture. The master builder, as an inscription at the archway under the entrance to Ossian's Hall sets forth, was Master John Baxter, sen., while Master James Blaikie was master carpenter. In the fifties of the present century wings were added to the central portion to the designs of Mr. David Bryce, with a façade of 180 feet and a depth of 78 feet. The mansion thus covered a superficies of 15,000 square feet, and contained sixty-four rooms, arranged in three flats. The building was associated with some of the richest memories of Scottish literature, and only the other week an Italian contributor to the *Scotsman* testified how far-reaching these associations were. At one time it was stored with historical paintings, rare books and many exquisite works of art; but within recent years the mansion has been greatly denuded of its art treasures, many of these being dispersed under the hammer of a London auctioneer, and only a few weeks ago some of the rarest books in the library realised, in a three days' sale in the Metropolis, a sum of over 1,700*l.* For about 130 years the mansion was the abode of the Clerks, but three years ago it was let to Lord Kinnear, who occupied it for two seasons, and at present it is tenanted by Mr. R. B. Ranken, W.S., Edinburgh.

Mrs. Ranken was the only member of the family at home at the outbreak, Mr. Ranken having gone to his office in Edinburgh, whilst the other members of the family were either at business or at school. The fire was noticed by several of the servants almost simultaneously, but by that time it seemed to have got a firm hold. The butler states that he resides at Corntown, and was returning to the mansion about 12·55, when he observed smoke issuing from the side of the kitchen chimney. He went to the top of the house upon the flat roof, and found the north wing on fire. Mr. Buchanan, land steward, was early notified of the outbreak, and he despatched messengers on cycles for assistance, while at the same time he assembled the estate fire brigade, who set to work with their manual engine, drawing water from a tank attached to the house, and afterwards from Scobie's Well. Mr. Buchanan and his men were driven back by smoke, and soon it was seen that the most powerful appliances were necessary to cope with the fire. No time had been lost in telegraphing to Edinburgh for assistance, and Police-Inspector Reid also telephoned to the county police office, where in turn they communicated with the central fire brigade office in High Street. Lieutenant Allan immediately had a steamer and eight men under way, and they covered the distance in fifty-eight minutes. Meantime Bailie Wilson had despatched the Penicuik Fire Brigade, and Messrs. Cowan kindly lent their steamer from Valleyfield, and the alarm having reached Glencorse Barracks, Captain Nash and fifty soldiers, with their engine, were despatched. An unfortunate accident occurred to the Valleyfield steam-engine, which disabled it, and the most of the work fell to the Edinburgh steamer. It drew water from the pond referred to, which is 200 yards distant from the house, and the Penicuik and military engines also did good service.

Hundreds of people gathered to the scene, and there was no lack of willing service. In the course of the afternoon Firemaster Pordage arrived, and assumed the direction of affairs. The energies of the men were concentrated on saving the lower floors, and special attention was given to the charter-room, in which are stored some invaluable historical documents, many of which were recently collated by Professor Lauler, Dublin. In the work they undertook the firemen were fairly successful. The saddest incident of the afternoon's havoc was the crashing-in of the ceiling of Ossian's Hall, which occurred at four o'clock, and which carried with it to utter ruin Runciman's great masterpiece.

Early in the afternoon Mr. Buchanan directed attention to saving the movables in the various rooms, and scores of willing workers joined in the salvage. Soon the spacious lawn was filled with the articles thus saved, which comprised furniture, paintings, &c. A body of workers paid special attention to the paintings, which are of great value. Ample accommodation was found at the stables and offices for the articles saved. Many antique works were included, and special attention was devoted to the famous Equation clock, which is entailed on the estate, and is one of the most wonderful timekeepers in the world.

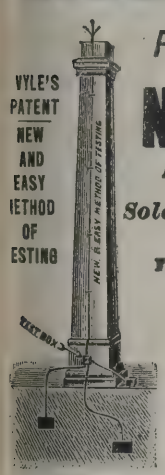
THE LARGEST MANUFACTURERS OF WOOD CHIMNEYPIECES IN THE KINGDOM.

Established over 20 Years.

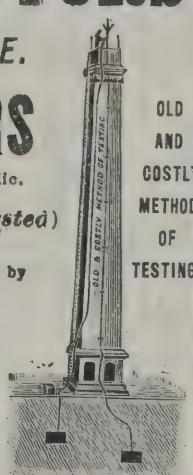
By six o'clock the firemen had obtained in great part a mastery over the fire, but such was the extent of the building that for hours afterwards parties of firemen found ample employment in quenching the embers. A fresh detachment of men arrived from Edinburgh, and prepared to remain on duty all night. No serious casualty occurred, although Private Barron, Royal Scots, got his arm severely cut by a falling window. Hundreds of spectators visited the fire in the evening, but they were kept at a convenient distance by the police. The damage is estimated at between 30,000*l.* and 40,000*l.*, and the building is insured.

THE READING SYSTEM OF FILTRATION.

THE chairman of the waterworks committee of the Reading Corporation, Mr. Alderman Hill, lately invited the members and some friends on an excursion to the various works which have been undertaken to supply water to the town.

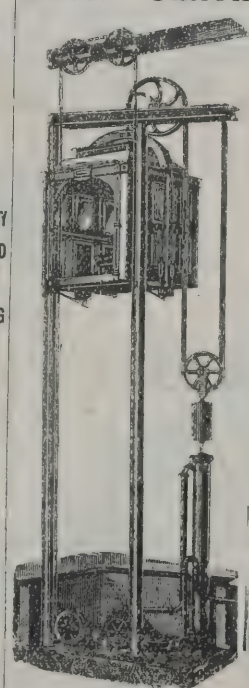


Arrived at the Bath Road works, says the *Reading Mercury*, Alderman Hill explained in detail the damage caused by the recent giving way of the bottom of the southern reservoir, and also gave information as to the general works at this, the headquarters of the present water-supply to the borough. He said that until a few years ago the water was pumped up absolutely unfiltered from Fobney or Southcote into the reservoirs, with the result that leeches and other objectionable things were frequently discovered in it. However, the filter area at Fobney was gradually increased as time went on, and by the use of polarite and other systems of filtration at Southcote the difficulty of providing the town with a pure supply had been satisfactorily grappled with. The water is now filtered and pumped up into the northern reservoir, then into the middle well, and then by engines into the high level tanks, and so distributed throughout the town. The works at Fobney can be relied upon to pump 4,000,000 gallons per day. At a future date it was proposed to cover the southern reservoir, which has so unexpectedly collapsed, in order that the filtered water should not be exposed to the air. It is the intention of the committee to have everything at the Bath Road works in duplicate so as to avoid any possibility of a failure in the supply. Having referred to the manner in which the southern reservoir suddenly developed a leak owing to a shifting bed of loose sand, Mr. Hill explained the objects served by the various wells, &c., upon the site.



The Proposed Reservoirs at Tilehurst.

The company next drove to the site of the proposed high-level service reservoir at Tilehurst, which is on the crown of the hill, near what is locally known as the "City." Here the Corporation have acquired five acres of land.



Alderman Hill said that the great difficulty in Reading in regard to the water supply is connected with the high-level supply, the whole of which is obtained from the tanks at Bath Road and Whitley. These tanks are not sufficient to keep the supply going at times when the demand upon them is very great, notwithstanding the fact that the engines are always pumping. The supply is consequently somewhat intermittent occasionally. As the inconvenience arising from this cause increases year by year, as the town grows in size, the water-works committee, rightly considering that such a state of things was not to be tolerated in a town like Reading, decided that the best course of action for them to adopt was to obtain a piece of high land near the town and build a reservoir thereon capable of commanding the water supply of every house in the borough. A plot of ground has accordingly been secured near Tilehurst "City," and there as soon as the provisional order is obtained a reservoir to hold five million gallons will be constructed, the basin being kept constantly filled by means of steam pumping power. Care has been taken to secure a sufficient quantity of land to enable the Corporation to provide additional storage capacity if in years to come the growth of the town should render this desirable. To show the importance of the question of levels and the value of the new site, it was pointed out that the tank at Whitley, including the standpipe, is 295 feet above Ordnance datum; the crown of Marshall's Hill, the highest point in Reading, is 266 feet; Emmer Green, 269 feet, and Caversham Warren, 253 feet. At Tilehurst an elevation of 337 feet has been secured, or 40 feet above the standpipe at Whitley. When the new reservoir, therefore, is completed, the question as to the supply at high level will be settled for ever. And it must be borne in mind that in addition to the improvement in the pressure the town will have the benefit of an increase in the volume of water stored ready for use, so that the necessity of pushing on the work of construction as much as possible will be readily understood. The mains will proceed down Langley Hill to the Bath Road, and thence to the Borough, and as no private property will be interfered with, and no easements have to be secured, it is anticipated that no difficulty will be experienced in laying the pipes, this being of considerable

VOLUME LX. OF THE ARCHITECT.
Handsomely bound in Cloth, Gilt Lettered, price 12s. 6d.
Office Imperial Buildings, Ludgate Circus, E.C.

Vol. LX. of THE ARCHITECT. Handsomely bound in Cloth. Price 12s. 6d.

advantage in connection with public works executed under Parliamentary powers.

In reply to questions, Alderman Hill said that when the works at Tilehurst are completed the pressure will be sufficient to admit of a jet of water 30 feet high being thrown over any house in Reading. It was not proposed to always admit the pressure to the lower parts of the town, because of the damage which would result to fittings and so on; the supply would be regulated by means of valves, so that if in a case of emergency a pressure of water greater than the ordinary was necessary, the temporary requirements of the district could be met in suitable fashion.

The party then drove, *viâ* Langley Hill (following to some extent the route which will be traversed by the mains from Tilehurst reservoirs to Reading), to the new Southcote works, formerly known as the "Weir Mills."

Here Alderman Hill explained the system of water filtration, and had it practically illustrated under the management of Mr. Walker, who passed the Kennet water through the various sections, the result being a perfectly clear and pure effluent. The practical introduction of polarite as a purifier of water is due to Mr. Walker, the next town to successfully adopt this splendid system of filtration (which is now known far and wide as "the Reading system") being Hastings. Mr. Walker's method provides for perfect filtration, combined with remarkable economy in area and cost; and this was fully and practically demonstrated when the company saw the process, being aided in their appreciation of the works by the remarks of Alderman Hill, and the practical demonstrations by Mr. Walker and his son. Upon leaving the Kennet the water first passes through a bed of coke, next through two beds of polarite and two beds of sand alternately. It is then transferred to the filter well, and finally pumped by water power into the Bath Road reservoirs. By the adoption of water as the motive power of the pumps at Southcote the necessity of providing fuel is obviated, and consequently there is a great saving here in working expenses when compared with the cost of the Fobney works, where steam power is employed. When the polarite and sand need cleansing they are taken by barges to Fobney. The coke is not used a second time, it having been found that as fuel its value does not deteriorate in consequence of the use to which it has been put. At Southcote, as at Tilehurst, the committee have had the forethought to secure sufficient ground to allow of an extension of the works if necessary. In the course of his remarks here, Alderman Hill said he thought it was right that the waterworks committee should justify themselves as far as possible from time to time. The estimate for all the work executed at Southcote was put down at 4,000*l*. Of that sum 2,919*l*. had already been spent, and when everything had been completed he hoped that the total cost would not exceed 3,100*l*. Considering what some people's estimates were, he thought that that condition of affairs was to the committee's credit. It had been largely brought about by the fact that their engineer had experienced less difficulty than he had anticipated with regard to the rising main, and also because he had used a great deal of old material.

PATENTS.
